# VCPs are in cities big and small (Source Apportionment)

The fraction of VCP emissions increases with population density. Even in a place as small as Boulder, VCP emissions are nearly as abundant as mobile source VOCs

Based on mobile lab measurements

*Gkatzelis et al. (2021), ES&T*

# WRF-Chem model: VCPs Needed to Explain Ozone

Ozone during heatwave, July 2, 2018

VOC sensitivity analyses at ozone maximum

## Key

## Takeaways

- Significant fraction of ozone attributed to VCPs, which are not well quantified

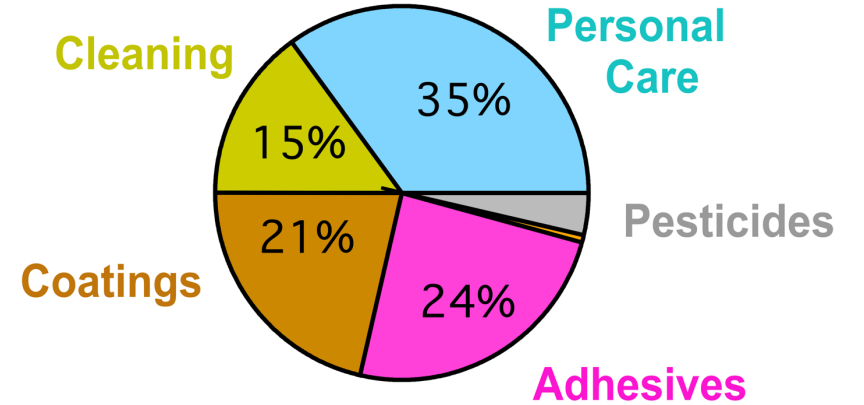

Learn more: *Coggon et al. (2021), PNAS*

# Box model: Attribution of ozone

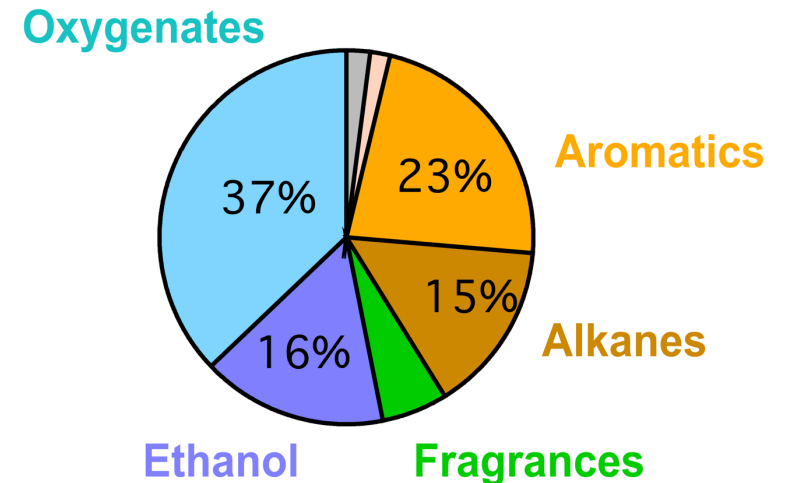

Ozone during heatwave, July 2, 2018

Breakdown of VCP ozone by category

Breakdown of VCP ozone by functionality

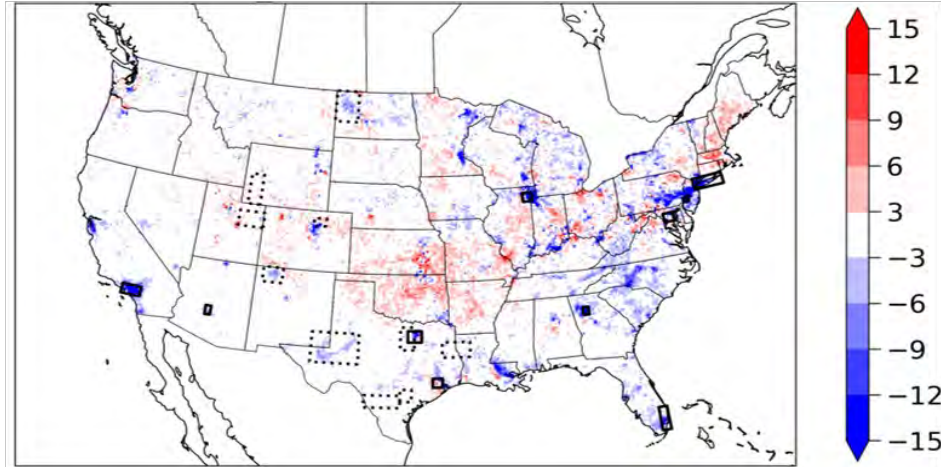

Key  
Takeaways

- Most VCP sectors contribute to ozone formation

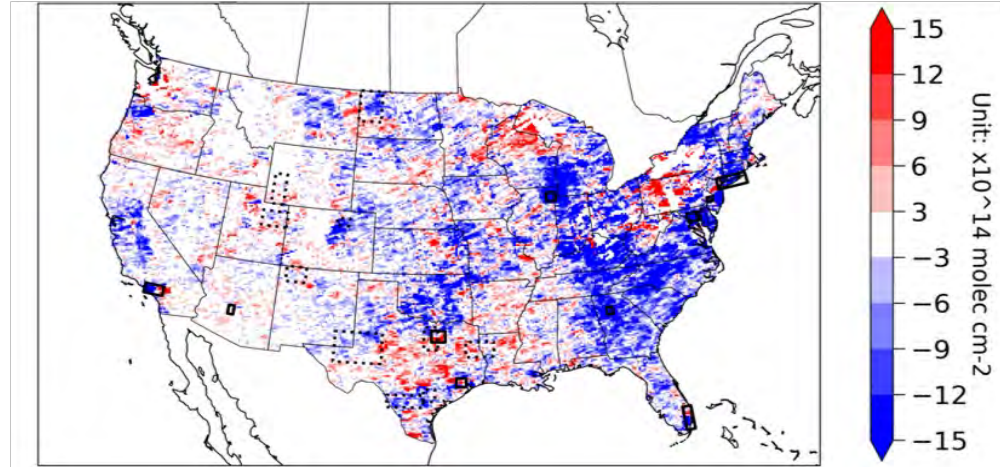

Learn more: *Coggon et al. (2021), PNAS*

# Four Different Satellite Products

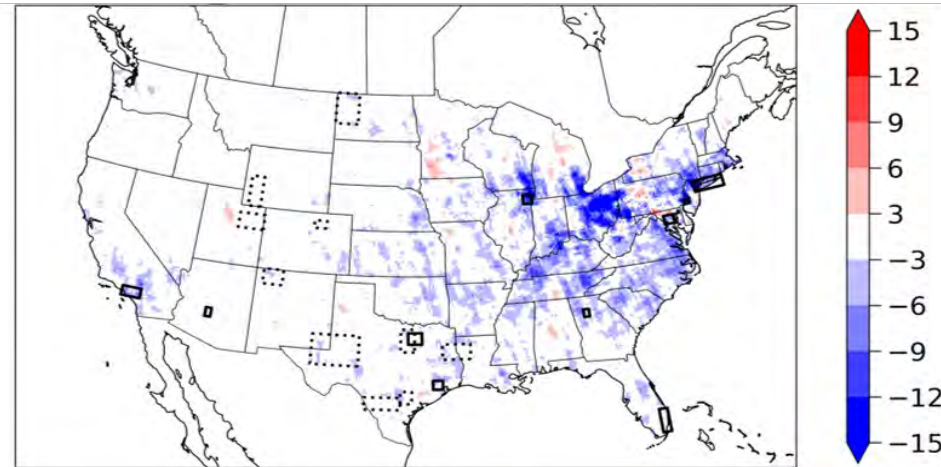

Sentinel-5P TROPOMI

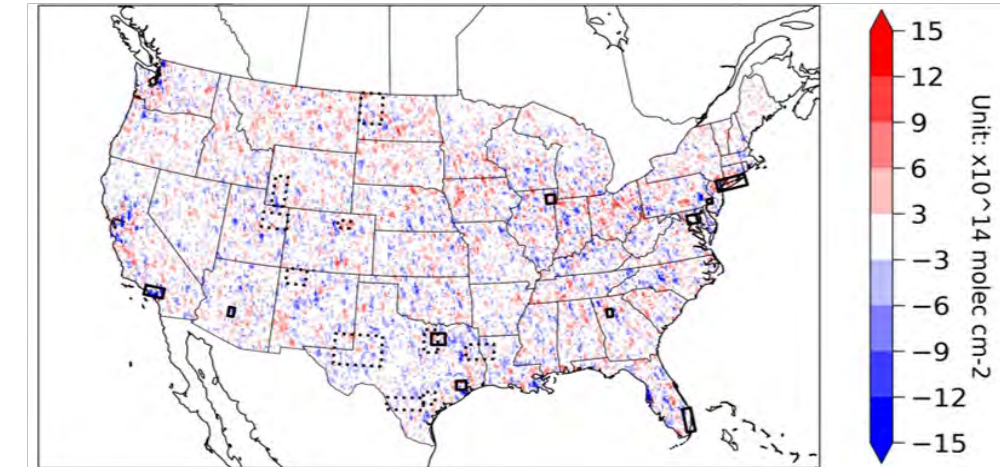

Aura OMI

Suomi-NPP OMPS

NOAA-20 OMPS

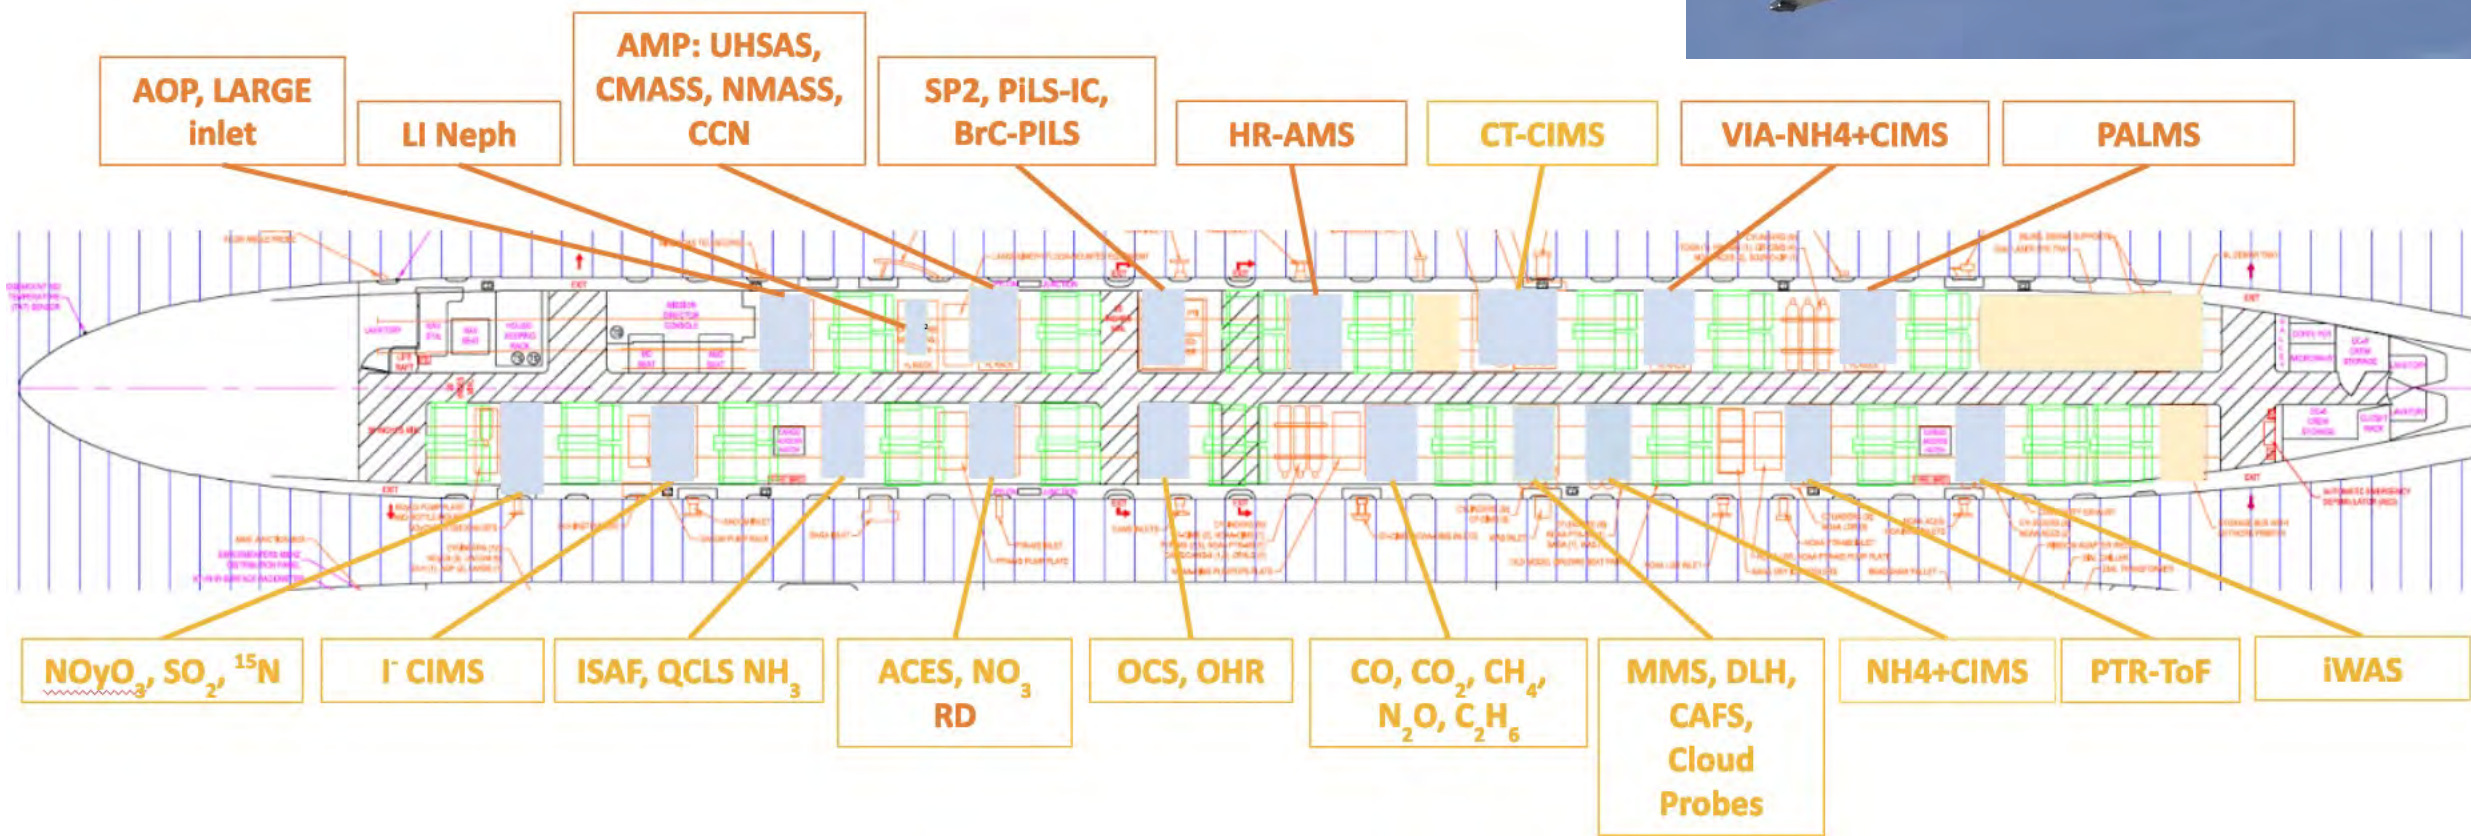

The four different satellite instruments clearly **do not agree** well on their observations on how  $\text{NO}_2$  changed due to COVID lockdown measures.

# ***AEROMMA Urban Science Goals***

1. Determine **organics emissions and chemistry**, including of understudied VCPs and cooking in the most populated urban areas in the United States
2. Determine **reactive nitrogen emissions and chemistry** in major urban corridors (i.e., urban core to suburban and outlying rural areas) to understand the current importance of combustion and non-combustion sources
3. Determine **co-benefits** between managing **air quality and the carbon cycle**
4. Provide **observations for proving and reducing risk of TEMPO, JPSS, and GOES-R science and near real-time trace gas and aerosol products**
5. Provide field observations for **evaluating NOAA's next generation weather-chemistry models** and chemical data assimilation of atmospheric composition satellite data
6. Provide observations from heavy-lift in-situ aircraft, airborne remote sensing, and ground-based networks for **geostationary trace gas (NO<sub>2</sub>, HCHO, O<sub>3</sub>) and aerosol (AOD and ALH) products evaluation**

# AEROMMA DC-8 Instrument Payload

(Tentative, September 2022)

Majority of instruments from NOAA CSL:  
 Gas phase: GHG, NO<sub>x</sub>, VOCs, halogens, sulfur, etc.  
 Aerosol phase: number, size, mass, composition, and optical properties

# AEROMMA DC-8 Instrument Payload

Species Measured	Technique	PI-name	Institution
<b>Gas phase measurements</b>			
O <sub>3</sub> , NO, NO <sub>2</sub> , NO <sub>y</sub> , 15N isotopes	NO <sub>y</sub> O <sub>3</sub> , <sup>15</sup> N	Andrew Rollins, Steven Brown	NOAA CSL
HPMTF, PANs, HONO, OVOCs, ClNO <sub>2</sub> , organic nitrogen	Iodide ToF-CIMS (I- CIMS)	Patrick Veres	NOAA CSL
CO, CO <sub>2</sub> , CH <sub>4</sub> , H <sub>2</sub> O	Cavity Enhanced Absorption (LGR+Picarro)	Jeff Peischl	NOAA CSL
CO, CO <sub>2</sub> , CH <sub>4</sub> , H <sub>2</sub> O	DLH, DACOM	Glenn Diskin	NASA Langley
SO <sub>2</sub>	Laser Induced Fluorescence	Andrew Rollins	NOAA CSL
OCS	Cavity Enhanced Absorption	Andrew Rollins	NOAA CSL
NH <sub>3</sub>	QC-TILDAS (QCLS NH <sub>3</sub> )	Ilana Pollack	CSU
CH <sub>3</sub> COCHO, CHOCHO, NO <sub>2</sub> , UV aerosol extinction	Cavity Enhanced Spectrometer (ACES)	Carrie Womack	NOAA CSL
Speciated hydrocarbons and OVOCs	H <sub>3</sub> O <sup>+</sup> Vocus ToF-CIMS (PTR-ToF)	Carsten Warneke	NOAA CSL
C <sub>2</sub> -C <sub>10</sub> Alkanes, C <sub>2</sub> -C <sub>4</sub> Alkenes, C <sub>6</sub> -C <sub>9</sub> Aromatics, C <sub>1</sub> -C <sub>5</sub> Alkyl nitrates, etc.	Whole Air Sampling (iWAS)	Jessica Gilman	NOAA CSL
Hydro- and halocarbons	Portable Flask Package (PFP)	John Miller	NOAA GML
Formaldehyde (HCHO)	Laser Induced Fluorescence (ISAF)	Jennifer Kaiser	Georgia Tech
Highly Oxygenated VOCs	NH <sub>4</sub> <sup>+</sup> Vocus ToF-CIMS (NH <sub>4</sub> +CIMS)	John Liggio	ECCC Canada
OH reactivity	Direct OH loss rate by LP-LIF (OHR)	Hendrik Fuchs	FZ Juelich
H <sub>2</sub> O <sub>2</sub> , organic peroxides, organic acids, isoprene oxidation products, etc.	CalTech-CIMS (CT-CIMS)	Paul Wennberg	CalTech
<b>Aerosol measurements (physical/optical/chemical)</b>			
Bulk aerosol composition, HNO <sub>3</sub>	Filter sampling and mist chamber (PiLS-IC)	Amy Sullivan	CSU
BrC	Spectro-photometer (BrC PiLS)	Rebecca Washenfelder	NOAA CSL
Aerosol absorption and extinction at multiple wavelengths and RH	Cavity ringdown extinction and photoacoustic absorption spectrometers (AOP)	Charles Brock	NOAA CSL
Aerosol scattering phase function at UV and visible (blue) wavelengths	Laser Imaging Nephelometer (Li-Neph)	Dan Murphy	NOAA CSL
Aerosol number density, size dist., and physical properties, CCN	Particle counters, nephelometers, etc. (UHSAS, CMASS, NMASS, CCN) (AMP)	Charles Brock	NOAA CSL, NASA LaRC
BC concentration, size, mixing state	Humidified-Dual SP2	Joshua Schwarz	NOAA CSL
Submicron aerosol composition	Aerosol mass spectrometer (HR-AMS)	Ann Middlebrook	NOAA CSL
Submicron aerosol composition	Vocus Inlet for Aerosols with NH <sub>4</sub> <sup>+</sup> CIMS detection (VIA-NH <sub>4</sub> +CIMS)	Carsten Warneke	NOAA CSL
Single particle composition	PALMS	Daniel Cziczo	Purdue
<b>Radiation</b>			
Zenith/nadir solar actinic flux and photolysis frequencies	4π-sr spectroradiometry (CCD)	Birger Bohn	FZ Juelich

# AEROMMA DC-8 Deployment Schedule

# Work in progress: Flight Planning

- Tier 1: Los Angeles ~3 flights + SARP  
New York (~4 flights)  
Chicago (~4 flights)
- Tier 2: Toronto (~3 flights)
- Tier 3: Houston (up to 1 flight)  
Atlanta (up to 1 flight)

We thank  
NOAA NESDIS  
for supporting  
AEROMMA2023
