3

Early Warning system in KMA

← Operation & Research →

1-2 “ Heavy dustfall ” in Seoul (2002 spring)

PM10

$\mu\text{g} / \text{m}^3$

7~9 April

1-3 Early warning

since April 2002

1. Advisory

An advisory is issued when the hourly average dust (PM10) concentration is expected to exceed $400 \mu\text{g}/\text{m}^3$ for over two hours.

- Outdoor activities for the elderly, the young, and those with respiratory diseases are prohibited.
- Kindergarten and elementary school students should stay at home and are advised against from doing outdoor activities.
- Strenuous outdoor activities are prohibited.

(500)

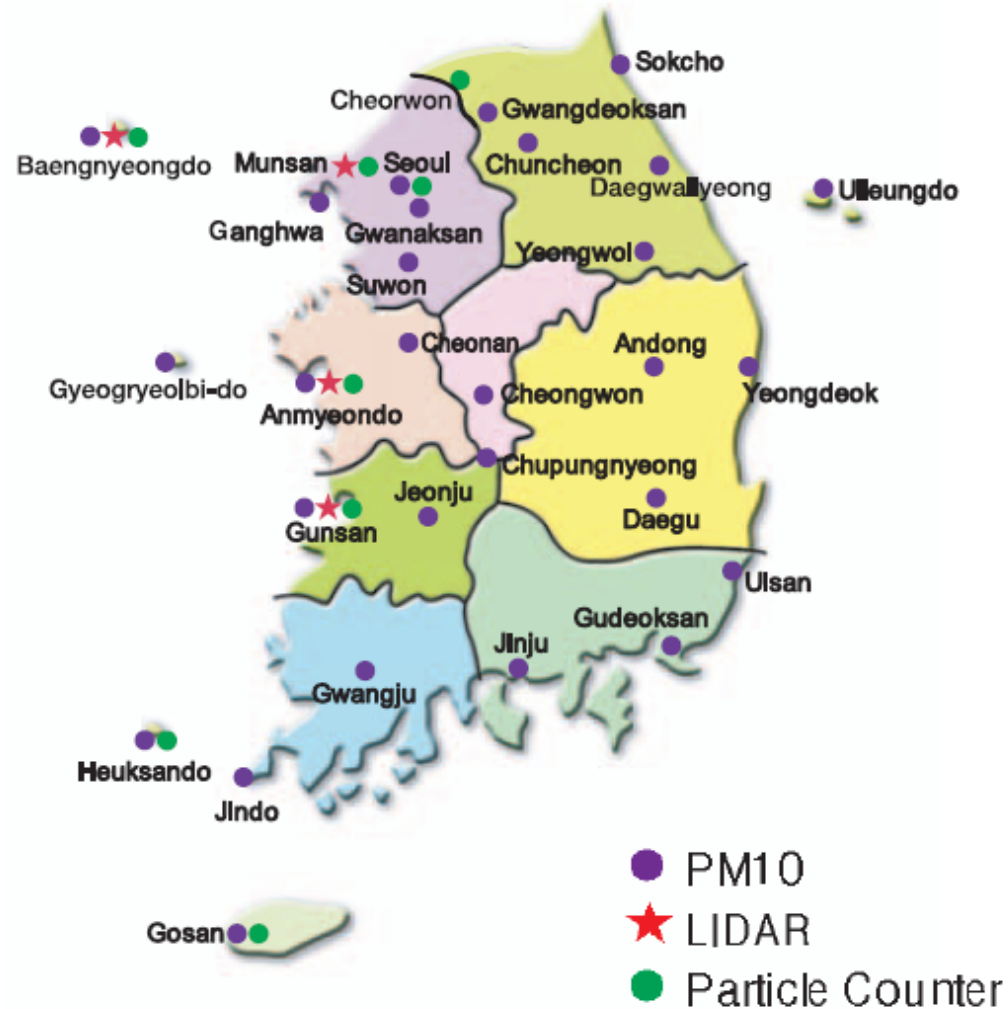

2. Warning

A warning is issued when the hourly average dust (PM10) concentration is expected to exceed $800 \mu\text{g}/\text{m}^3$ for over two hours.

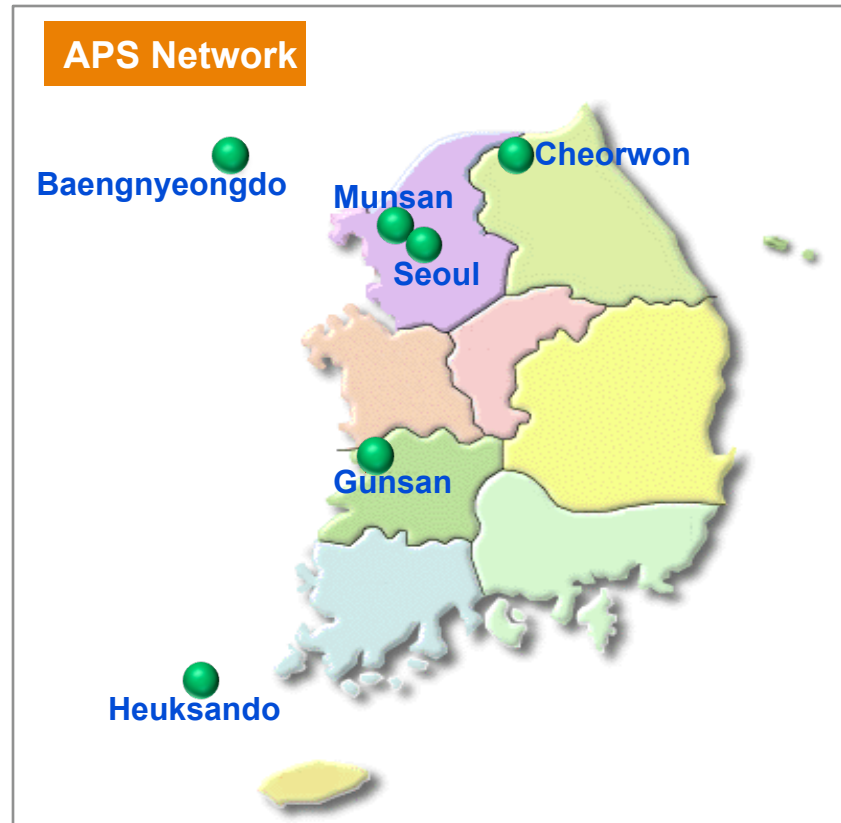

- The elderly, the young, and those with respiratory diseases are prohibited from going outside.
- Kindergarten and elementary school students are advised against doing outdoor activities, and classes should be dismissed.
- Outdoor activities are prohibited.
- Outdoor sports events should be rescheduled.

(1000)

2-1 KMA Monitoring Sites

2-2 Aerosol Particle Sizer Network

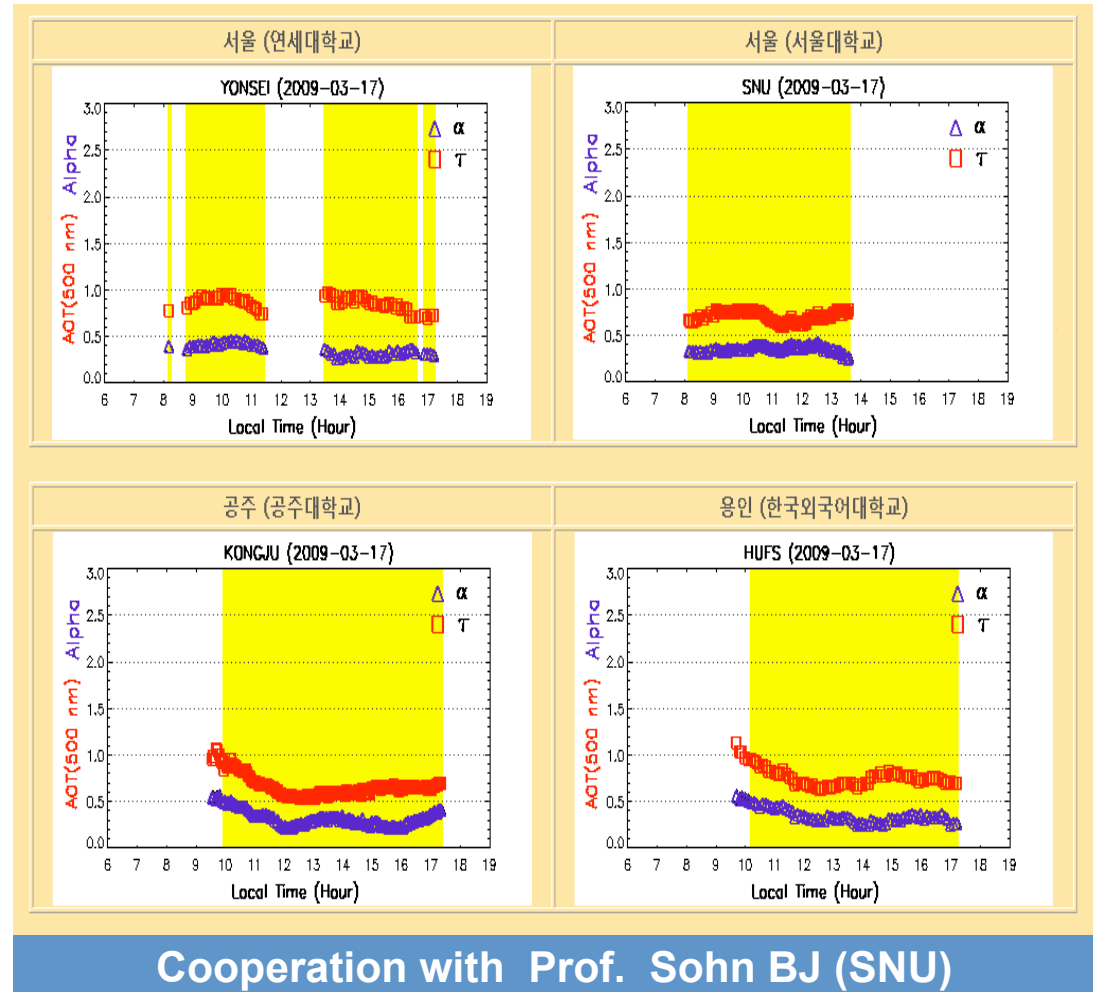

- Physical properties of aerosol
- 0.25 - 32 μm , 31 channels
- PM10, PM2.5, PM1.0

2-3 Optical Observation

Skyradiometer Network

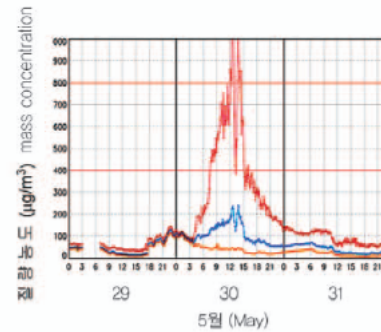

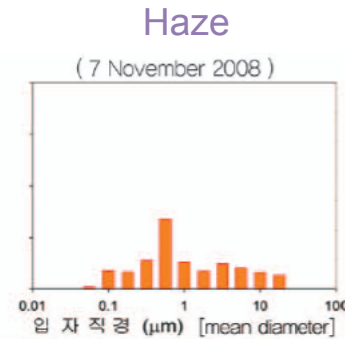

Cooperation with Prof. Sohn BJ (SNU)

- Detect Asian Dust in the higher altitude
- If Aerosol Optical Thickness > 0.5, and Angstrom Component < 0.5 then Asian Dust

2-4 Seoul Hwangsa Monitoring Center

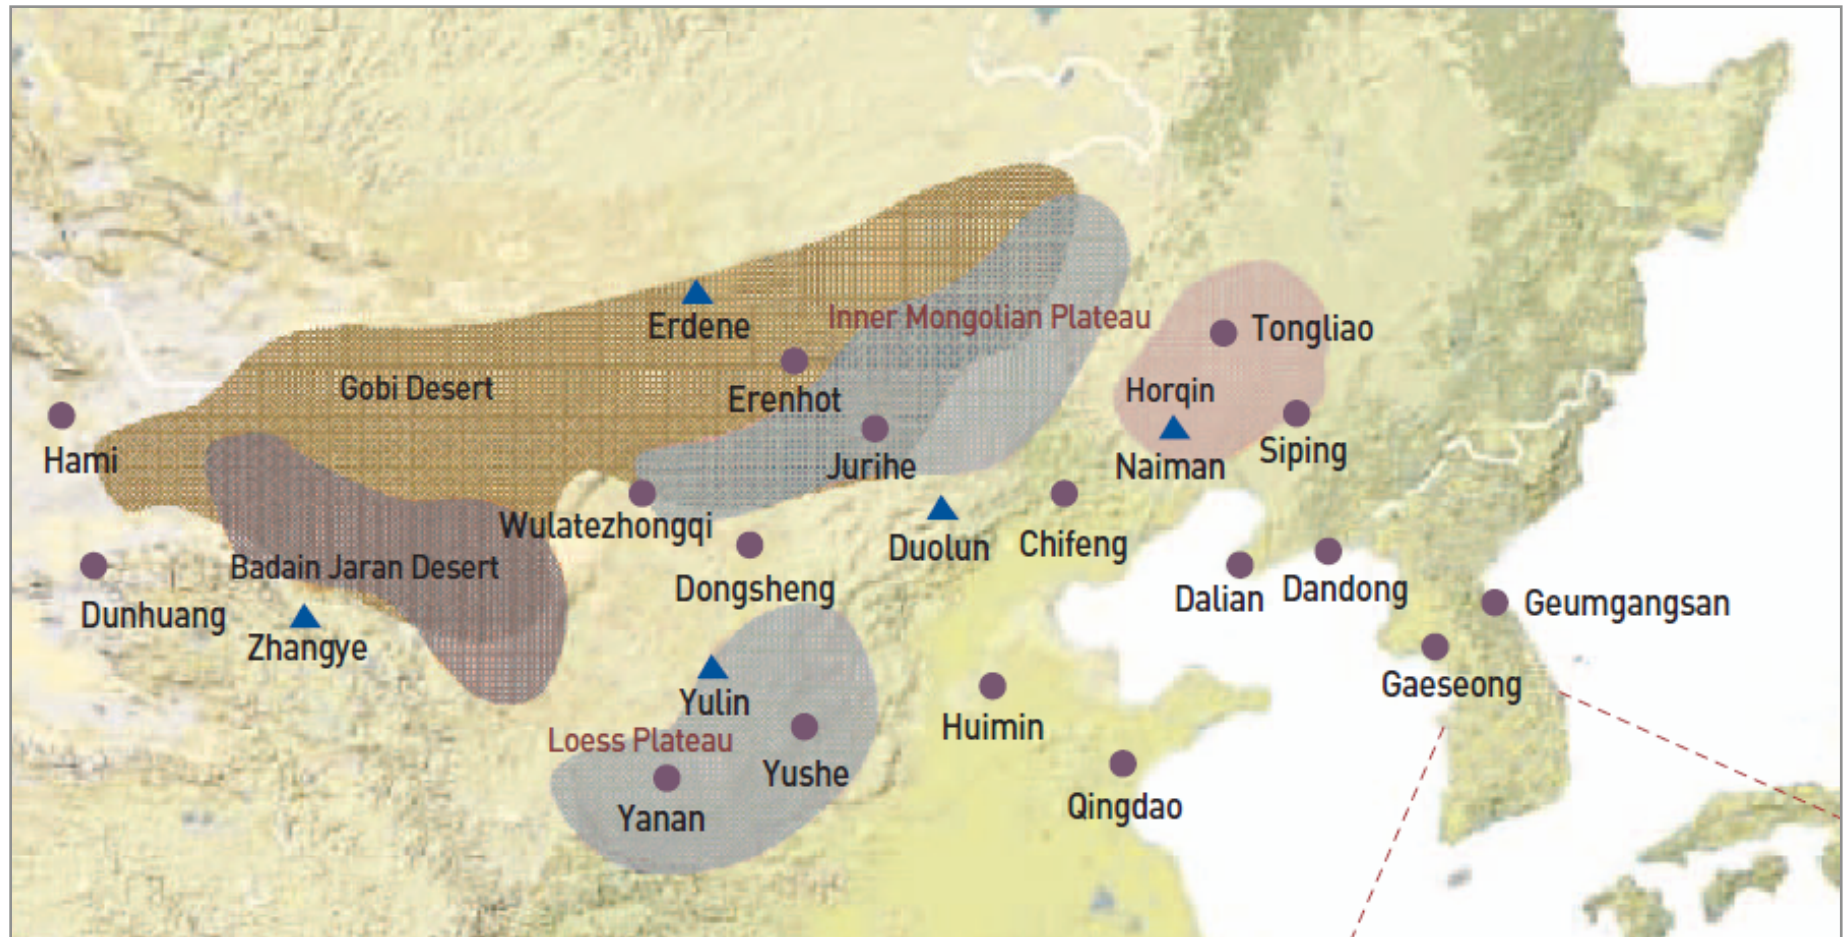

MOUDI 필터 (3호왕사: 16~17일 샘플링)

—Cl⁻ —NO₃⁻ —SO₄²⁻ —Na⁺ —NH₄⁺ —K⁺ —Mg²⁺ —Ca²⁺

2-5 Cooperated with China Meteorological Admin.

- Real time data sharing of PM10

2-6 Cooperation with Mongolia

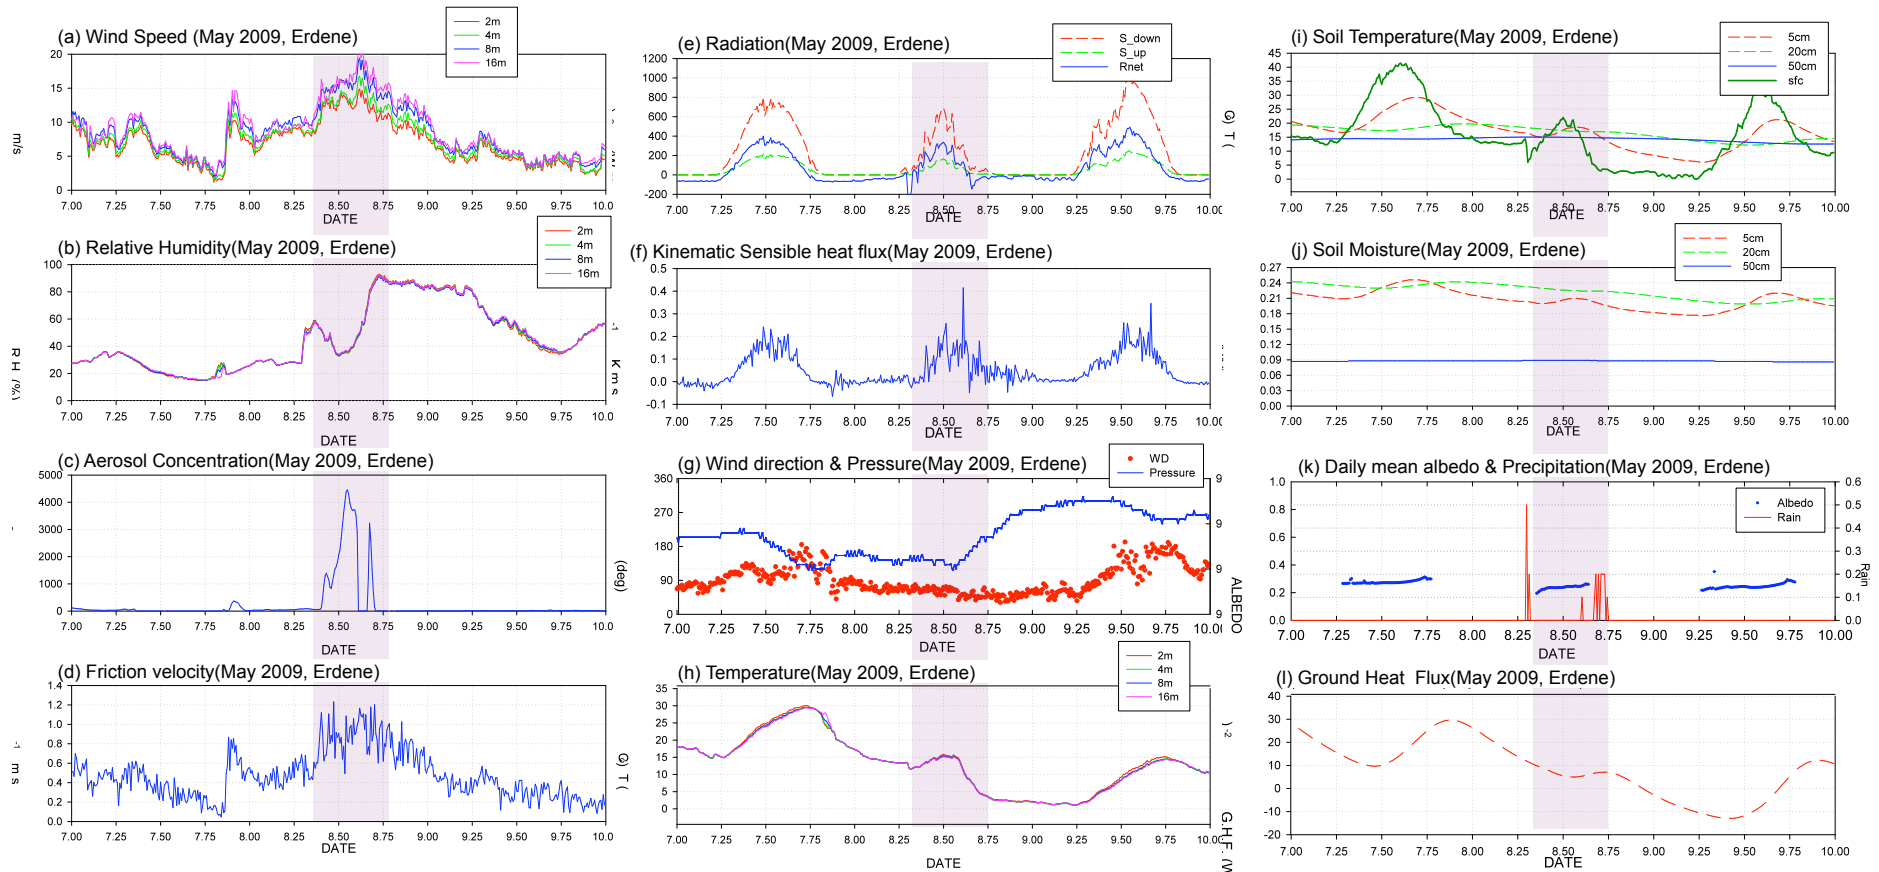

- 20m : Wind Speed, Direction**
- 16m : Wind Direction, Temperature, Humidity**
- 8m : Sonic anemometer, Temperature, Humidity**
- 4m : Wind Direction, Temperature, Humidity**
- 3 m : PM10 concentration**
- 2m : Wind Speed, Temperature, Humidity, Solar & Net radiation, Pressure**
- Surface : Rain gauge**
- Soil temperature : 5, 20, 50 cm**
- moisture : 5, 20, 50 cm**
- heat flux : 25 cm**

Cooperation with Prof. Soon-Ung Park (CAEM)

2-7 Dust storm monitoring tower in Mongolia (Erdene)

Cooperation with
Prof. S. U. Park (CAEM)

- Real time monitoring of SDS & meteorological condition for forecasting
- Parameterization of Dust Amount from meteorological data for ADAM

3-1 Early Warning system

Asian Dust

Sandstorms and/or duststorms that are affecting the Korean peninsula occur most frequently in the spring season in the arid and semi-arid area of sand deserts including Badainjara, Tengger, Mu Us, Hunsandakue and Keoeolchin, Gobi region and Loess Plateau in the Asian continent. The area of Asian dust source regions cover most of northern China and Mongolia.

Hwangsa Weather Chart

- Dust information obtained through naked eye observation which was collected via WMO GTS every 3 hours.
- This is very useful in recognizing the geographical location of dust plume.
- The data cannot be correct during the nighttime.

Asian dust retrieved from various satellites

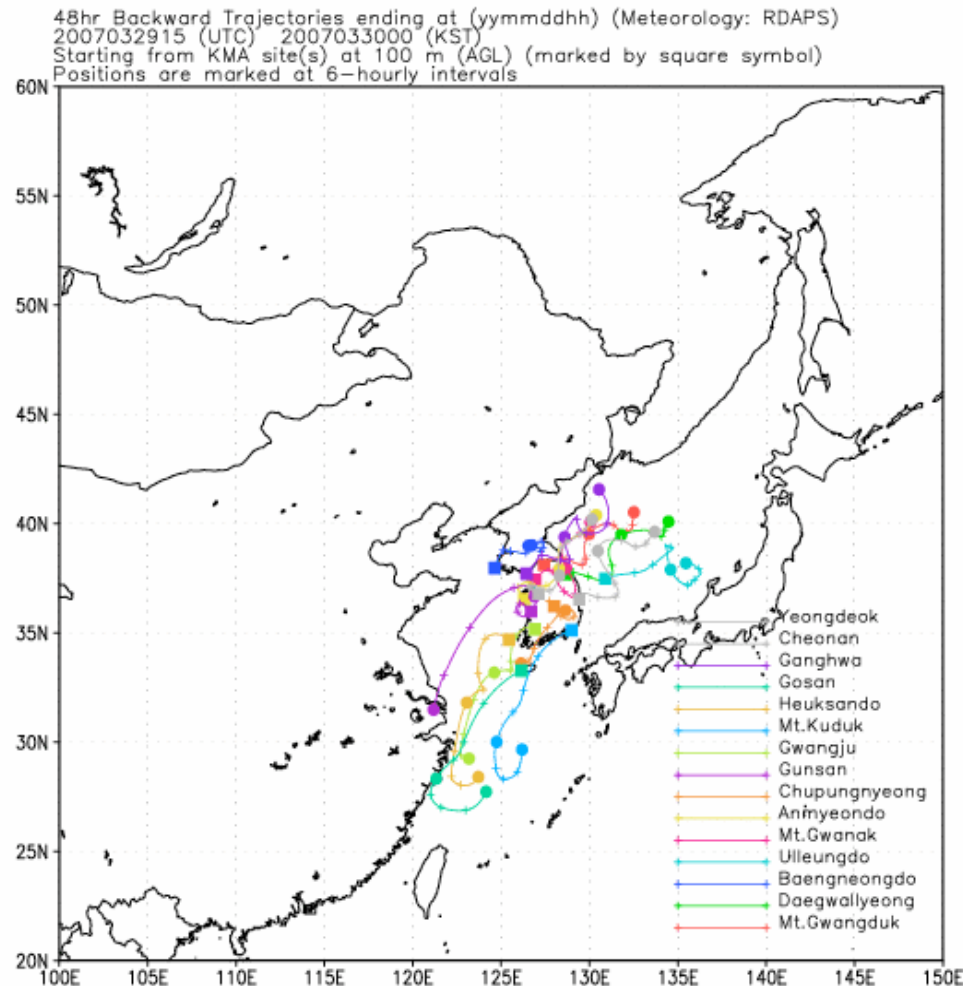

Satellite Images combined with PM10 in Korea

- Dust plumes are not well detected by the satellite observations.
- The dust plume confined in the PBL is seldom observed via satellite detection.

48hr Backward Trajectory Chart

- The backward air trajectories are dramatically changed along with the passage of dust plume.

- The backward trajectory analysis is useful in identifying the source region of dust plume.

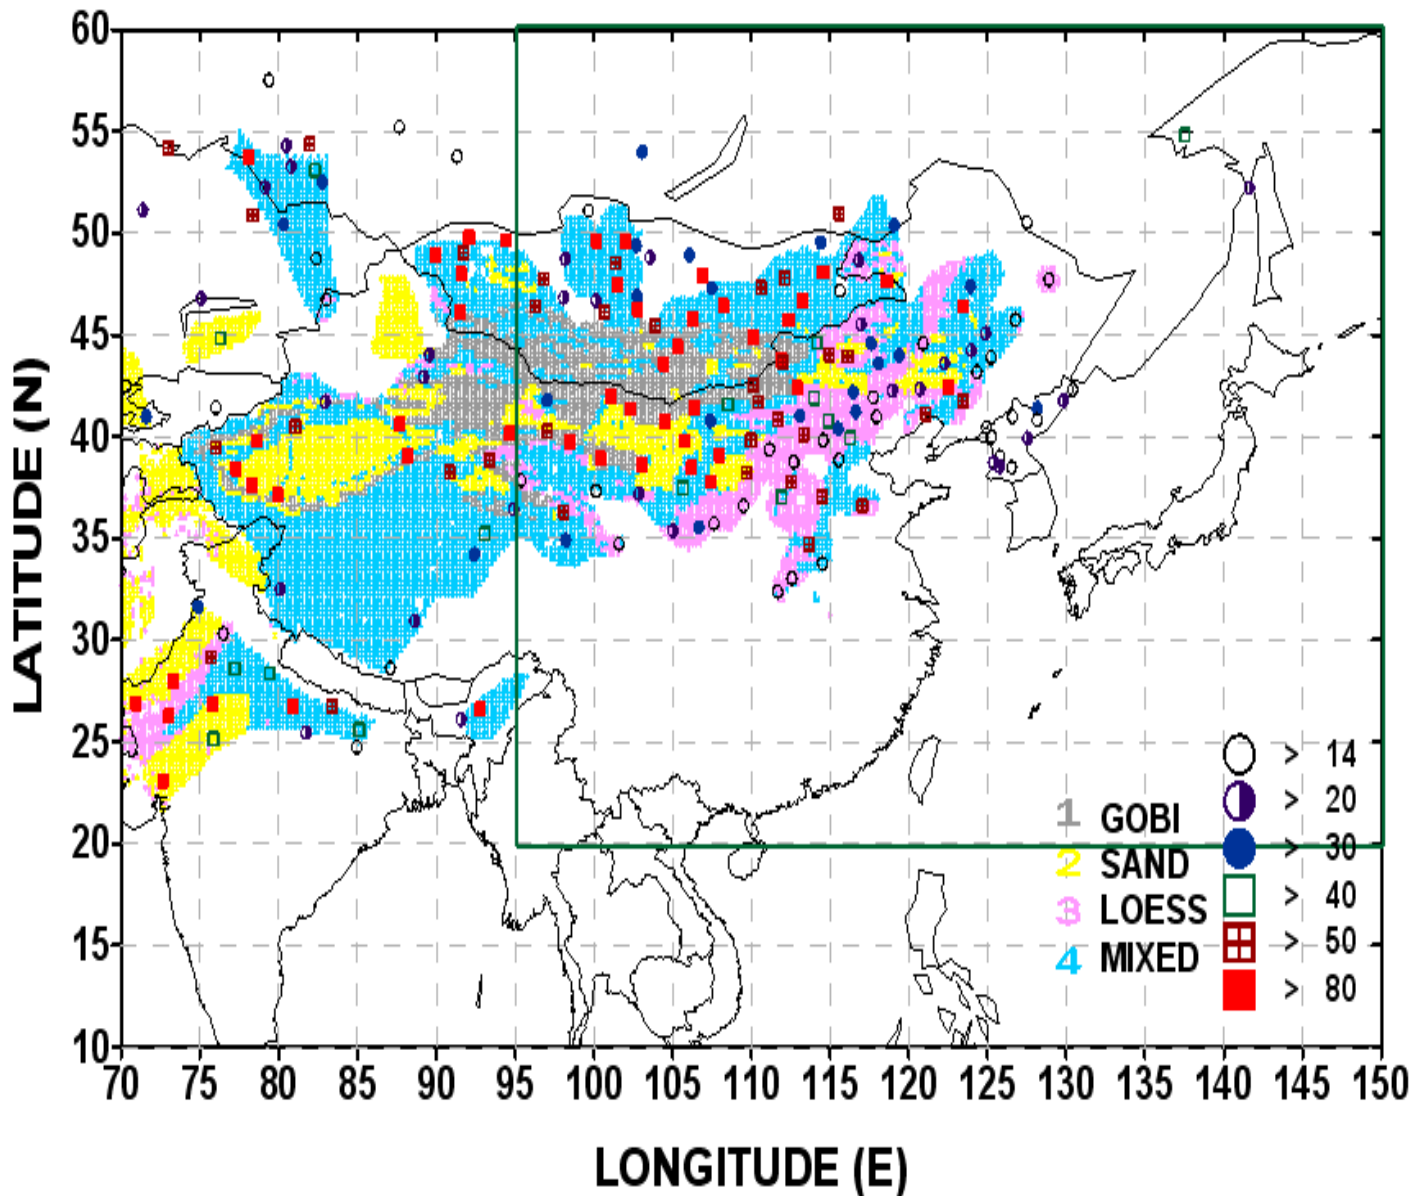

- Using NOAA/HYSPLIT Model

× This forecast chart is the simulation of predicting Asian Dust, and can be different from real time observation.

Asian Dust concentration Forecast

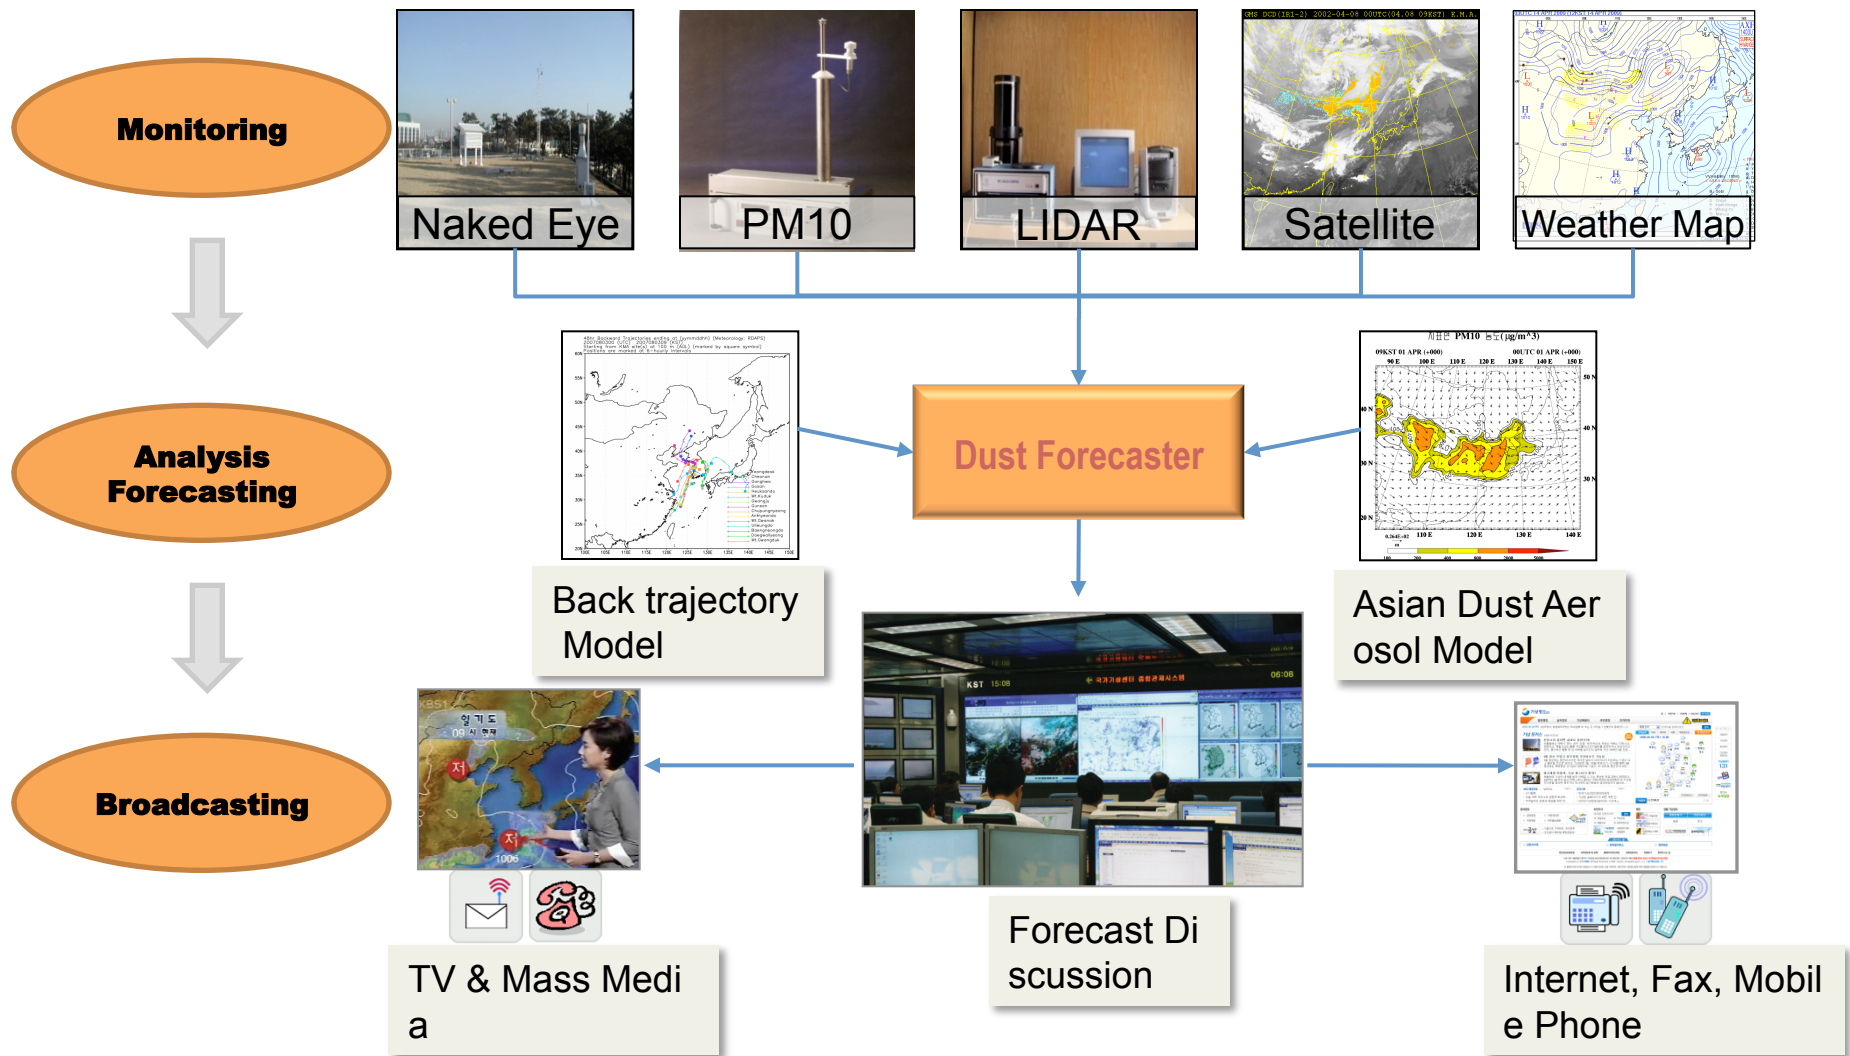

- Asian Dust and Aerosol Model (ver. 1) is used for dust forecasting in KMA.
- ADAM is driven by the KMA's regional operational weather model, RDAPS (Regional Data Assimilation and Prediction System) which was developed based on the MM5, twice a day at 00 and 12 UTC.
- The surface chart of PM10 concentrations is provided in 3hr intervals.

Expansion of ADAM domain

- By early 2010, KMA plans to adopt U KMO's UM(Unified Model) system as the new global and regional weather forecasting system.
- Using the Global UM output operated at the KMA, we extend the model domain of ADAM to enable it to cover some parts of Central, South, and Southeast Asia. (UM-ADAM)
- we plan to replace the current ADAM with ADAM ver. 2 in the year 2010.

Asian Dust Early Warning Procedure in KMA

- 1 Monitoring the Asian Dust episode in source regions with eye measurement and PM10 measurement using the Mongolia and China Joint Asian Dust Monitoring Networks.
 - 2 Investigating the horizontal distribution of Asian Dust using weather charts and satellite images.
 - 3 Estimating the movement of air parcel containing Asian Dust within 72 Hours with 3-hour interval.
 - 4 Simulating the trajectories, and concentrations of Asian Dust with a super computer.
 - 5 Identify the path and vertical distribution of Asian Dust with PM10 concentrations (28 sites)
- Finally, We inform the Asian Dust Forecasting results to the public through the mass media, internet, and Short Message Service in order to prevent the Asian Dust damages.

Summary

KMA has started a web site to provide operational and research products related to Asian dust as of October 2009

<http://sds-was.nimr.go.kr/support.html>

Currently, it contains following items:

- Forecast chart (twice a day at 00 and 12 UTC)
- PM10 concentrations at 28 sites in Korea (Chart & Table, every hour)
- Asian Dust Satellite Images (almost every 30 mins)
- Analysis Charts
- Asian Dust Weather Chart (every 3 hours)
- Visibility in GTS code (every 3 hrs)
- 48hr backward trajectories at observations sites in Korea
- Satellite images combined with PM10 concentrations

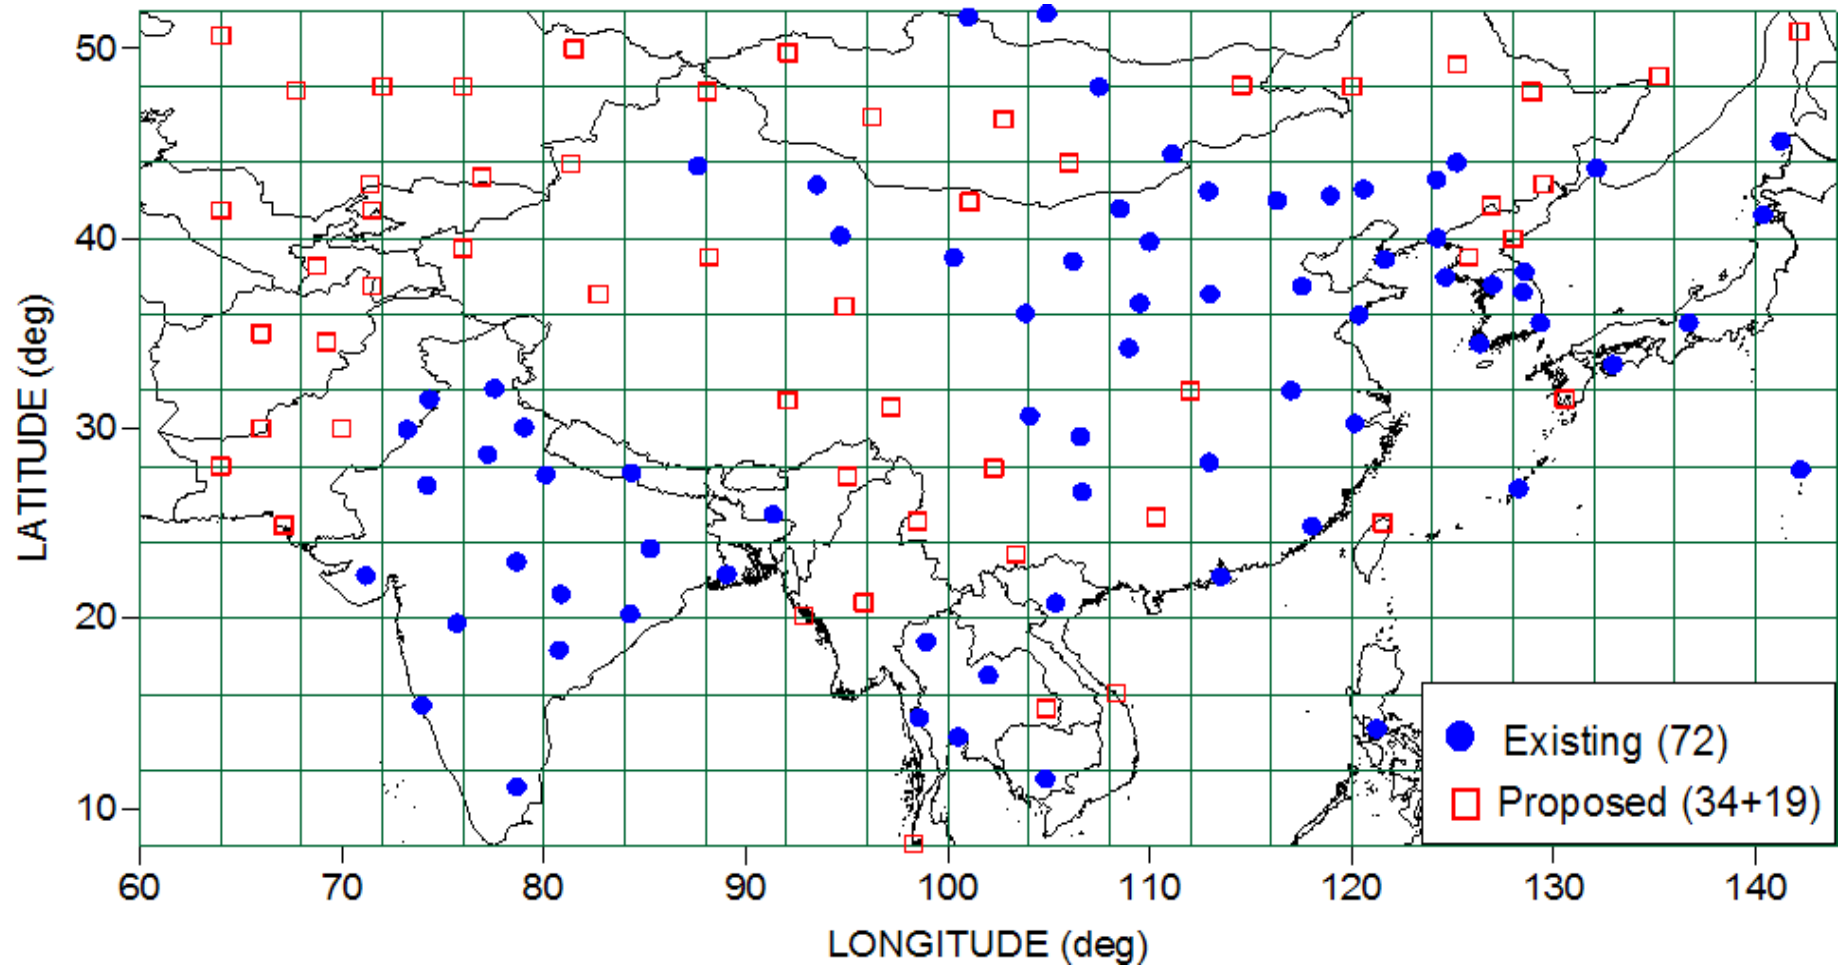

To achieve better understanding of Asian dust and Haze , the cooperative data sharing among the countries is indispensable.
