

AIR QUALITY RESEARCH OVERVIEW

Theme Lead: Dr. Steven Brown

StoryMaps under this theme

- 1.1 Air Quality: Emissions to Impacts
- 1.2 Wild & Prescribed Fires: From the Lab to the Field
- 1.3 Atmospheric Composition, Chemistry and Dynamics

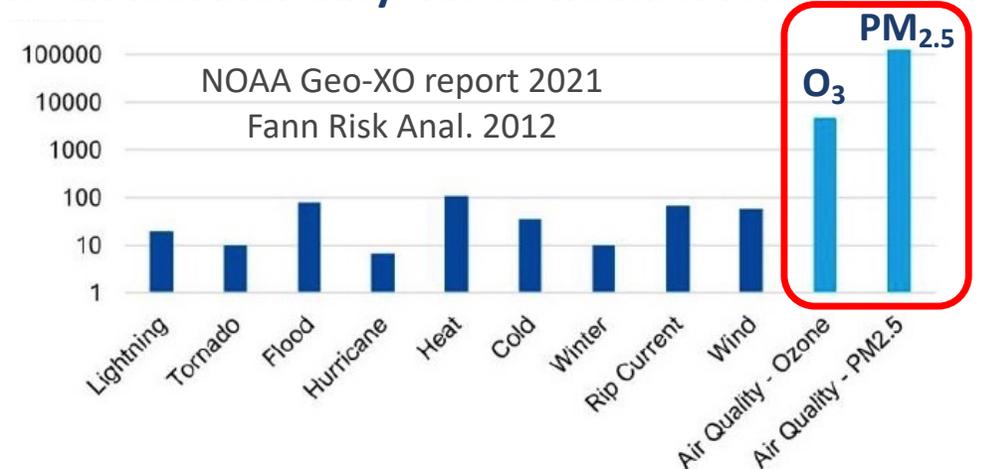

AIR QUALITY

CSL Air Quality Research – The Mission

- Detect changes in the ocean and atmosphere
- Make forecasts better
- Drive innovative science
- NOAA vision area: Reduce societal impact from hazardous weather & environmental phenomena

U.S. annual mortality due to weather related causes

Air Quality Impacts & Costs

Global

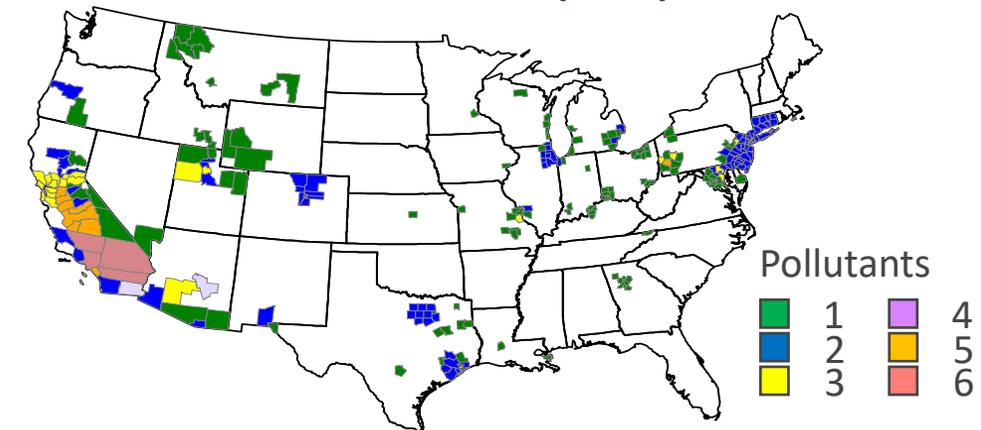

World Health Organization: ~7 million annual premature deaths; 4.2 from ambient (outdoor) pollution

United States

Goodkind PNAS 2019: Poor AQ responsible for >100,000 deaths, \$886 billion in damages annually

US EPA Green Book : 130 million residents in non-attainment areas (O₃: 122 million; PM_{2.5}: 31 million)

U.S. National Ambient Air Quality Standards (NAAQS) Non-Attainment Areas (NAA) 2021

Air Quality is a costly and deadly issue affecting millions of people in the U.S. and billions globally

CSL Air Quality Research – The Approach

Business Model

- Identify & define current air quality research needs
- Build partnerships with stakeholders & collaborators
- Execute & lead field intensives at a range of scales
- Laboratory studies of key chemical processes
- Interpret observations with research quality models
- Communicate findings to scientists, policy makers & the public

Deep Experimental & Modeling Expertise

- Instruments: State-of-the art trace gas, aerosol, meteorological
- Models: Emissions, mechanisms, 1-D, chemical transport
- Platforms: NOAA aircraft & mobile platforms, other agencies

Partnerships & Stakeholders

- State & local air quality agencies (CA, TX, UT, NY, CO, NV, etc.)
- Industrial (Oil & gas, agriculture, petrochemical, pwr. generation)
- Academic (Numerous partners, N. America & International)
- Federal agencies (NASA, EPA, NSF, DOE, USDA, JFSP, etc.)
- International (Europe, Asia Universities & National Labs, WMO)

- > 35 AQ field projects in the last two decades
- Ground, towers, mobile labs, ships, aircraft, laboratory
- Model development parallels field intensives

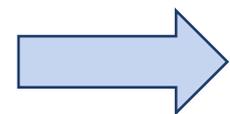

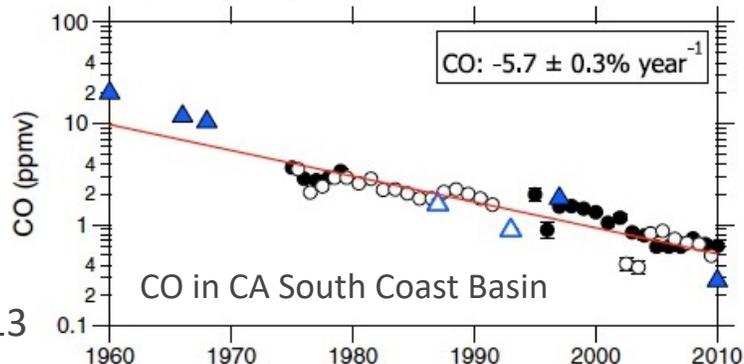

CSL is a premier air quality research institute

CSL Air Quality Research – The Science

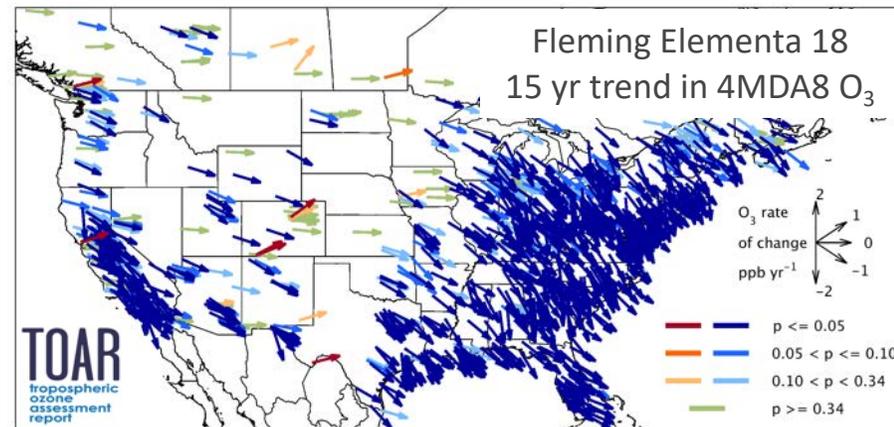

Emission reductions in the U.S. spanning 5 decades have redefined the science

Sustained reduction
in U.S. combustion
emissions

Pollack JGR 13

Dramatic
improvement
in urban O₃

Current topics (partial list, this review)

Volatile Chemical Products (VCPs) now dominate urban VOCs

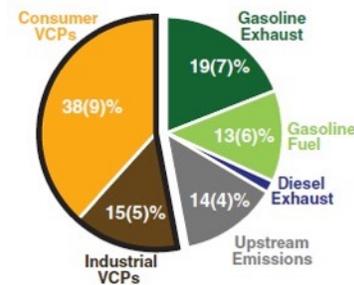

Biomass burning: Response to climate change & past suppression

North American oil and gas: Impact from 15 years of development

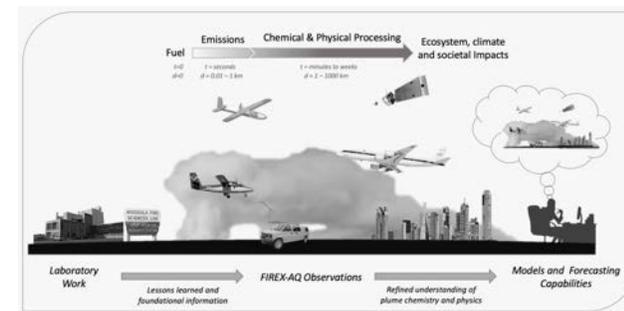

Summer vs. winter: Changing response of secondary pollutants

Constraints on global emissions & atmospheric composition

COVID-19 Lockdowns: A window into the future ?

McDonald Science 2018
Identify VCP Emissions

FIREX-AQ mission to
investigate biomass burning

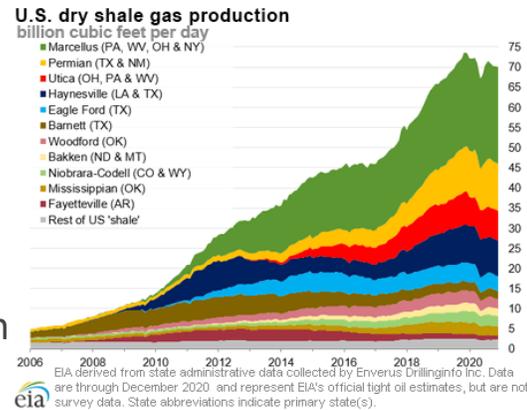

Scientific research underpins 50 years of progress in air quality and remains critically important today

Impacts of North American Oil & Gas Development

StoryMap 1.1.2

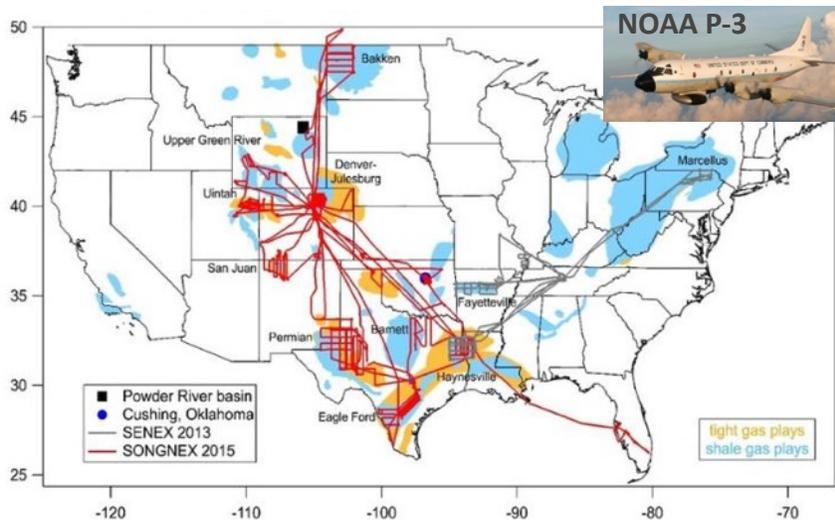

U.S. oil and gas production has increased dramatically since 2005, impacting GHG emissions and air quality

U.S. Energy Information Administration

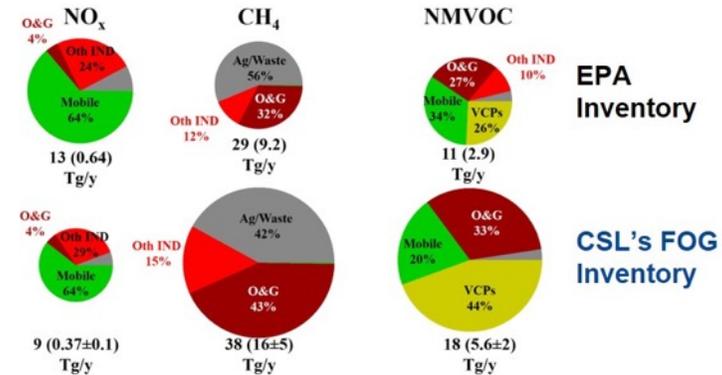

SONGNEX: Shale Oil & Natural Gas Nexus 2015

NOAA P-3 flights sampled more than 70% and 83% of U.S. shale gas and oil production, respectively

Fuel-based Oil and Gas (FOG) – Nationwide NO_x, methane and NMVOC Inventory

• FOG NO_x emissions nearly 2× smaller, VOC nearly 2× larger than EPA (NEI 2014) inventory

• Revised inventory agrees with top-down aircraft derived emissions to within 10% nationwide

Stakeholders: Oil & gas industry, state level air quality regulators, U.S. EPA

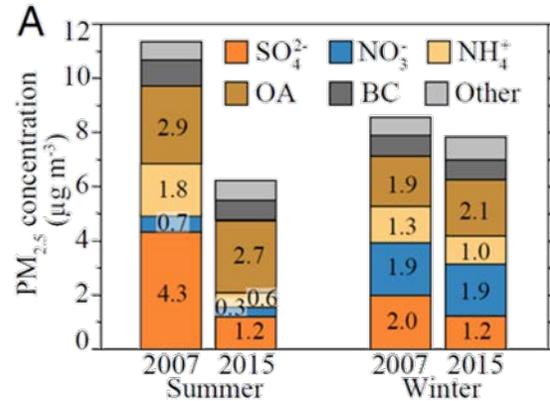

CSL research quantifies air quality and climate relevant emissions from U.S. shale oil & gas development

Winter Air Quality

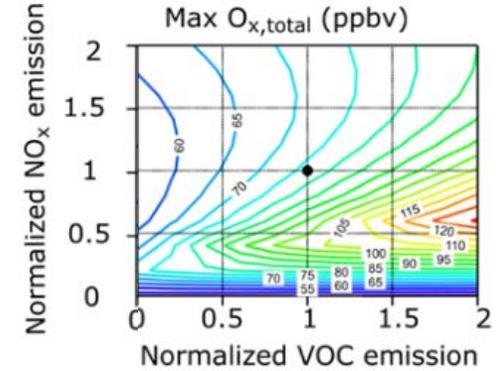

StoryMap 1.1.3

Response of PM_{2.5} to emissions reductions weaker in winter than summer - points to lack of process understanding

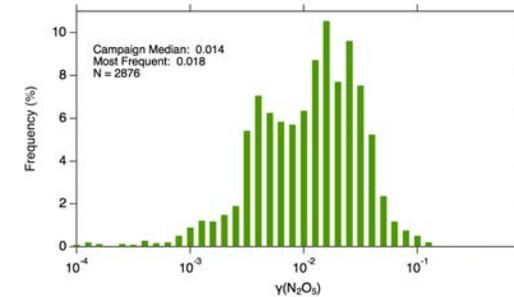

Shah PNAS 2018

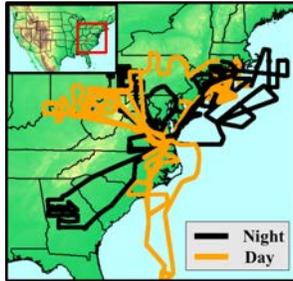

Womack GRL 2019: Winter PM_{2.5} treated as odd oxygen, mitigation strategy analogous to summer O₃

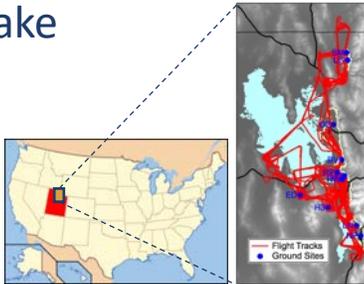

McDuffie JGR 2018a,b: Parameterize N₂O₅ uptake coefficients & ClNO₂ yields to improve regional and global models

WINTER 2015: U.S. East Coast, NSF C-130

UWFPS 2017: Great Salt Lake Basin, NOAA Twin Otter

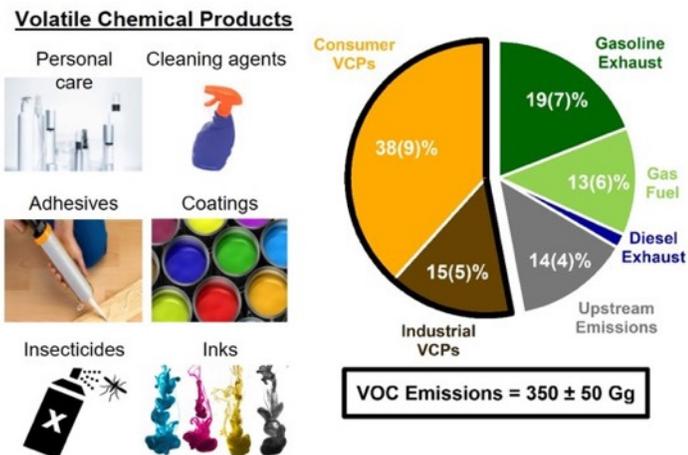

Stakeholders: Utah & East Coast AQ regulators, agricultural industry, NSF, EPA, international research community

CSL research provides fundamental process information to inform models and AQ mitigation strategies

VCPs: A New Paradigm for Urban Air Quality

StoryMap 1.1.4

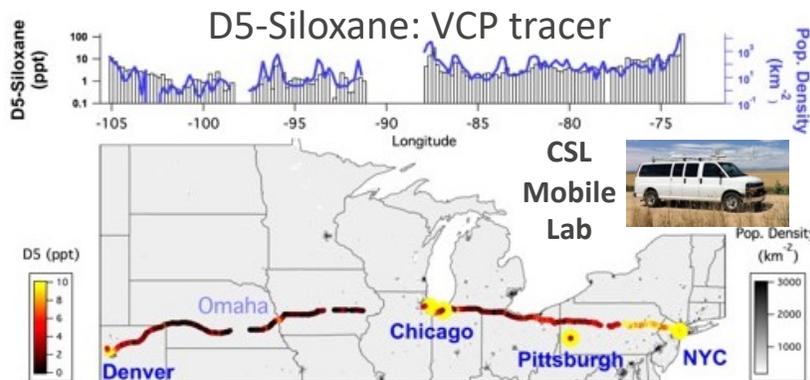

Volatil chemical products, VCPs, now exceed motor vehicles as urban VOC source

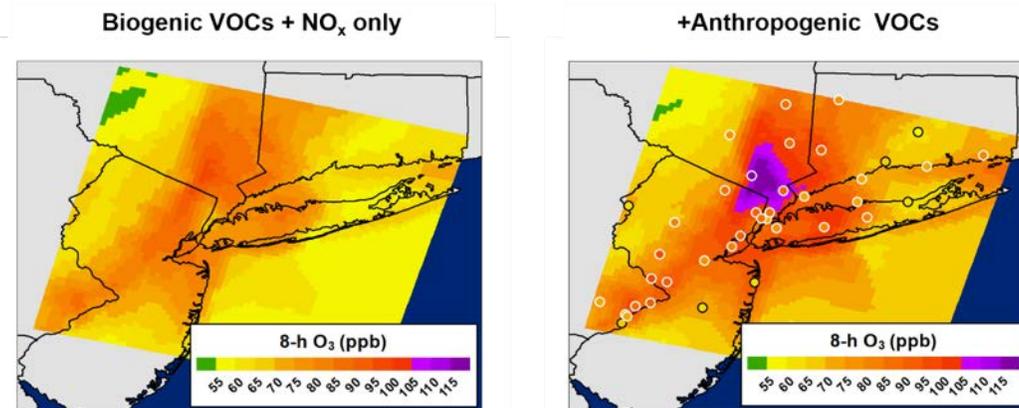

McDonald Science 2018

NY-ICE: New York Investigation of Consumer Emissions

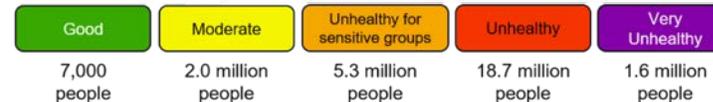

CSL mobile lab samples New York, other urban areas, winter and summer 2018

Coggon 2021 (in review): Updated urban VOC inventory improves O₃ models and quantifies role of VCPs

Number of people affected by high ozone according to Air Quality Index (AQI)

Stakeholders: Petrochemical industry, New York & Connecticut Air Quality regulators, EPA, NASA

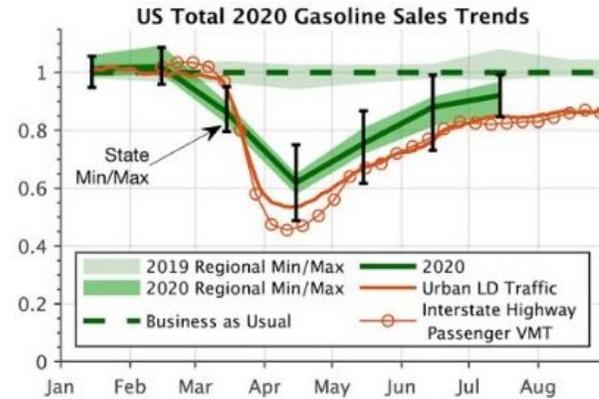

CSL research updates urban emissions inventory and improves predictive capability for O₃ pollution

COVID-19 Lockdowns: A Window into the Future of Urban Air Quality

StoryMap 1.1.5

The COVID-19 lockdowns in 2020 forced deep reductions in transportation emissions – potentially illuminating an electric vehicle future

Harkins in prep. 2021

CSL COVID-19 initiatives

- COVID-AQS: local field intensive in spring and summer 2020 & airborne measurements on east coast
- National network for intensive AQ measurements
- Rapid update of emissions inventories
- Organize AGU sessions
- Collaborate with FZJ & international partners to synthesize developing scientific analysis for IPCC

Timeline of NOAA Chemical Sciences Laboratory's COVID-19 Research Efforts in 2020

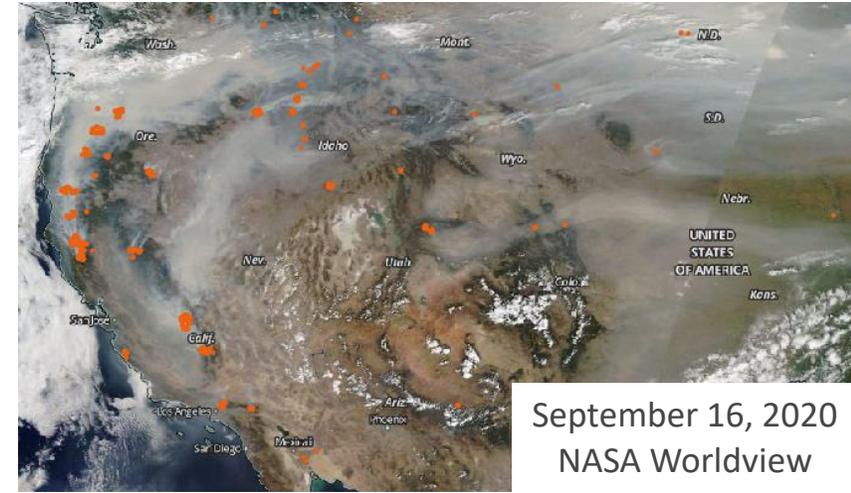

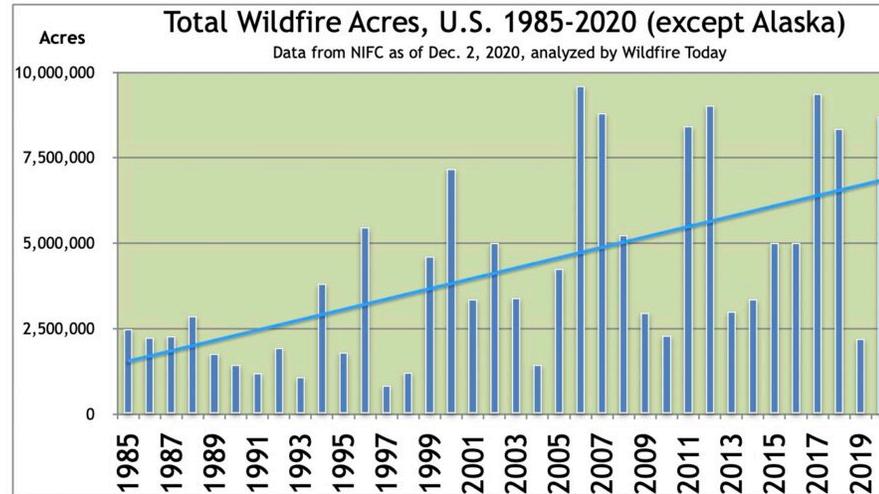

CSL provides national and global leadership to assess impacts from the temporary emissions reductions during COVID-19

Biomass Burning

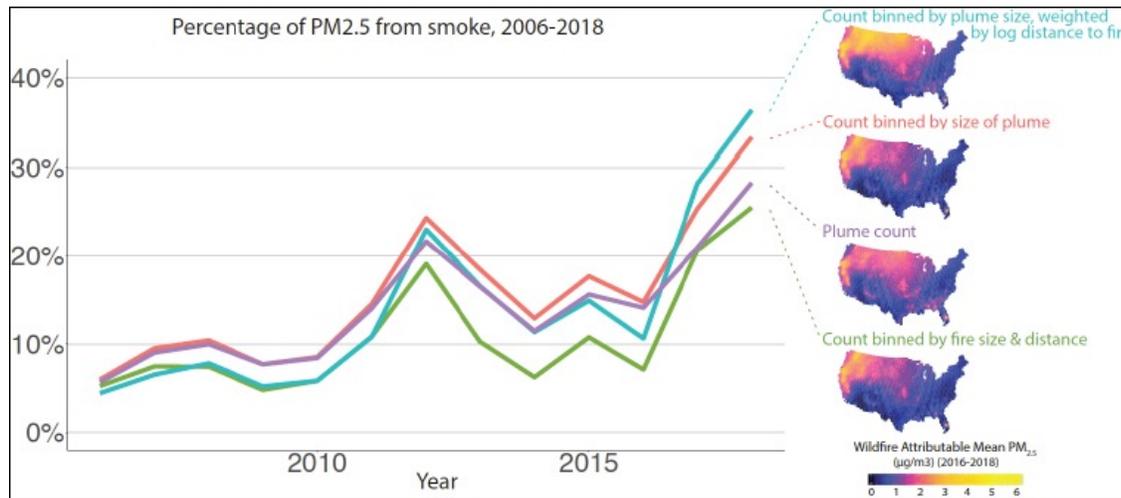

Wildfire area and biomass burning emissions are increasing in the U.S. as a result of climate change and past fire suppression

Wildfire Today
Dec 2020

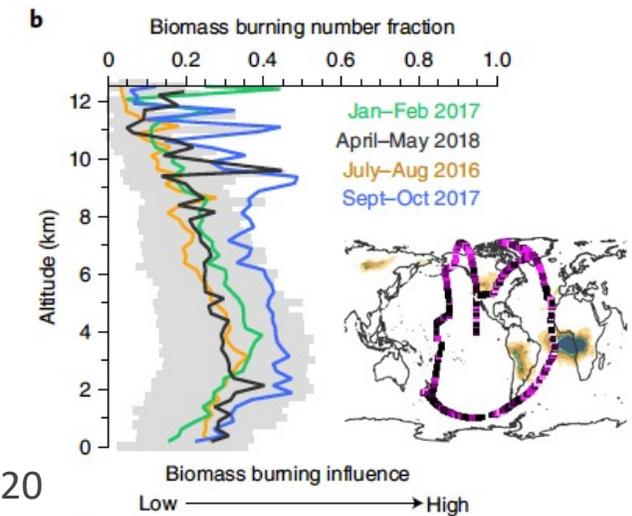

Biomass burning emissions increasingly affect U.S. air quality ...

Burke PNAS 2021

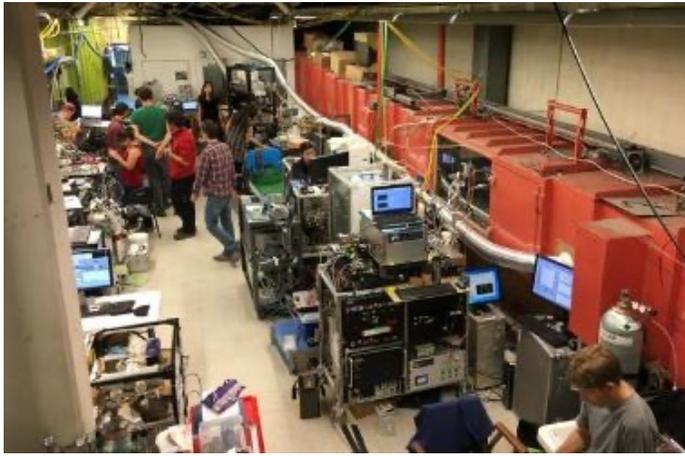

... and impact atmospheric composition at global scale

Schill Nature Geosciences 2020

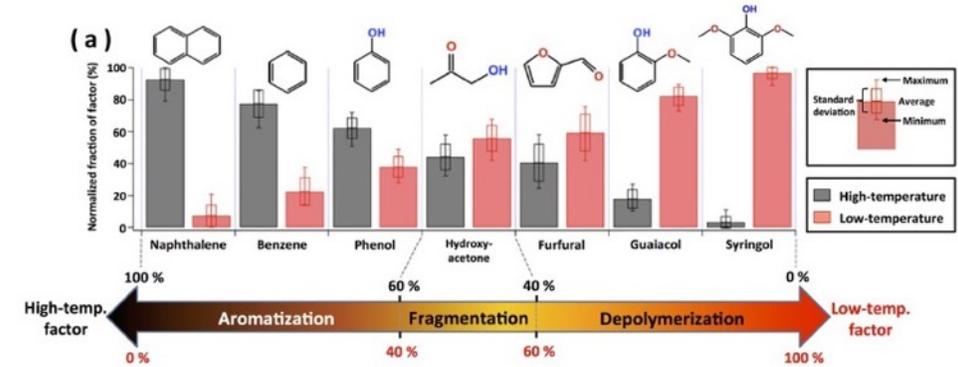

Biomass Burning – The FireLab

StoryMap 1.2.2

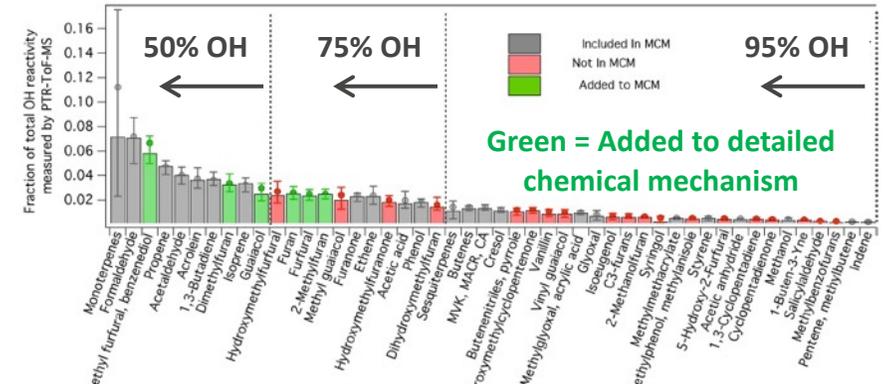

FireLab 2016 Campaign: USFS Missoula, MT Fire Sciences Laboratory
6 weeks, > 15 research groups, 50 instruments, 27 publications so far
Large scale campaign, suite of **new instruments** for updated emissions, chemistry

Emissions: Seikimoto ACP 2018 presents simple formalism comprising just two factors to represent complex fire VOC emissions

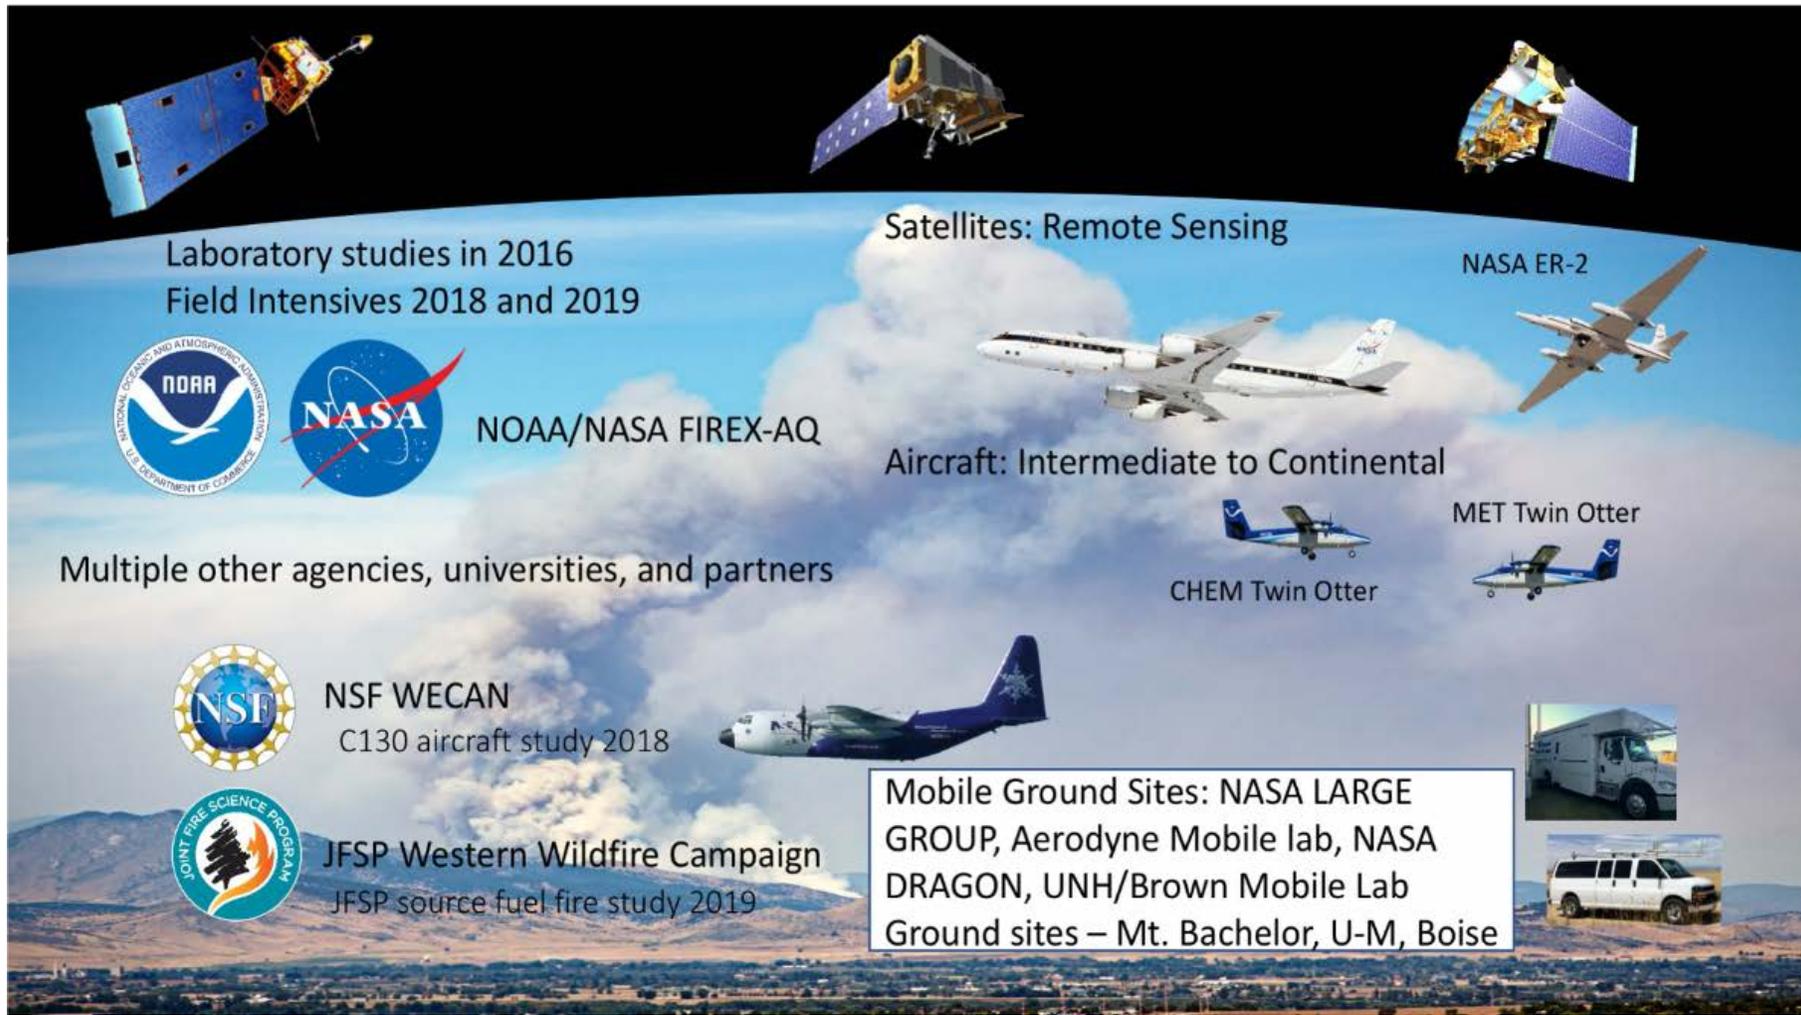

Chemistry: Coggon ACP 2019 identifies reactivity profile of fire VOCs to support chemical mechanism development and interpretation of field observations

CSL leads fully comprehensive biomass burning emissions & chemistry study

Biomass Burning – The Field Work

StoryMap 1.2.3

FIREX-AQ 2019

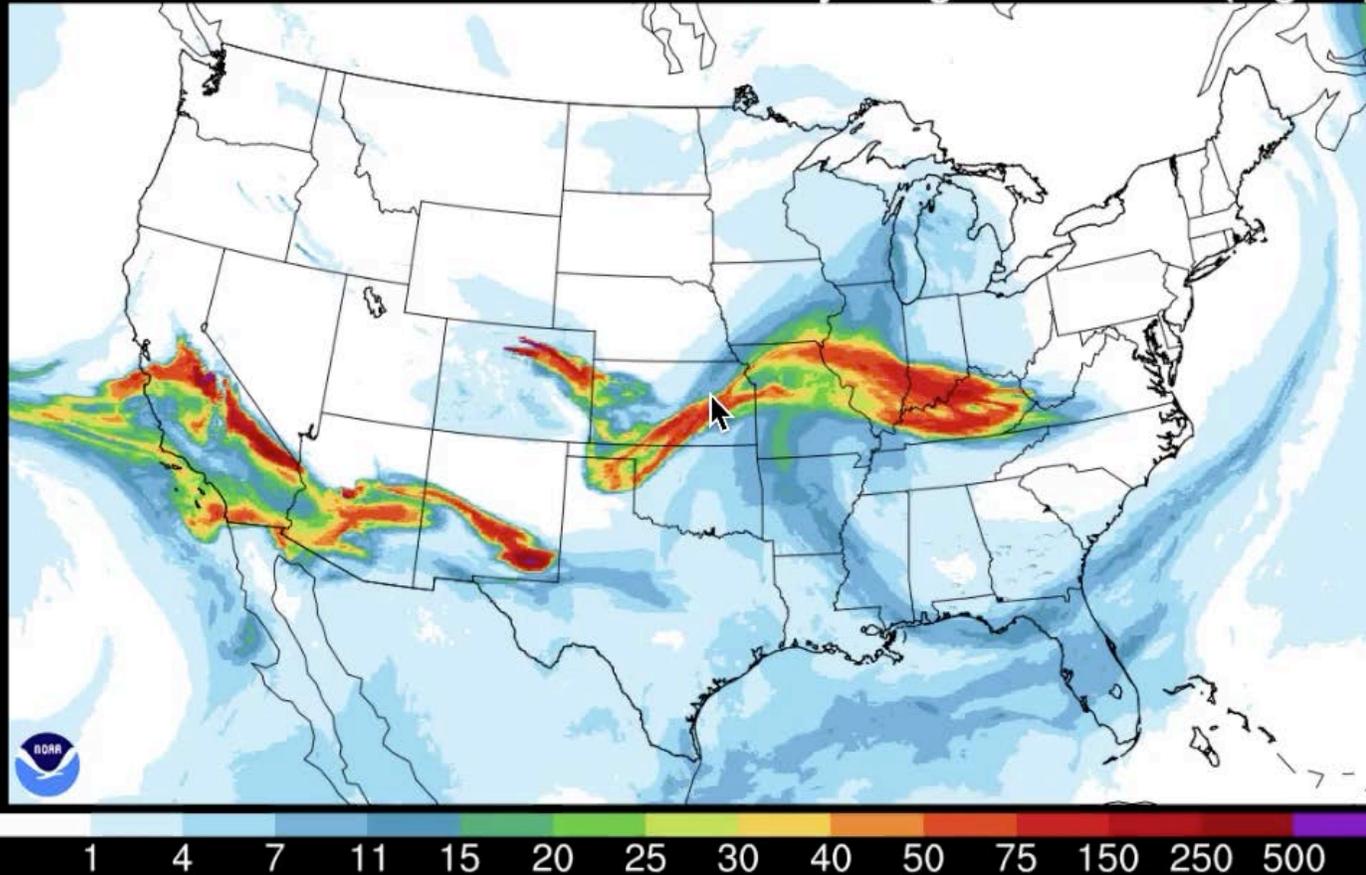

- 4 Aircraft (NASA DC-8, 2 NOAA Twin Otters, NASA ER-2)
- Mobile laboratories & ground sites (NASA LARGE, Aerodyne, DRAGON)
- Coordination with satellite remote sensing
- Partnership with wildland fire and fuels community
- NOAA & NASA together with other federal & state agencies (EPA, NSF, USDA, JFSP, CARB)

CSL leadership of large scale biomass burning intensive

Biomass Burning – The Models

StoryMap 1.2.4

HRRR-SMOKE 2020-10-17 12 UTC 6h fcst - Experimental Valid 10/17/2020 18:00 UTC
Vertically Integrated Smoke (mg/m²)

Biomass Burning Models & Forecasts

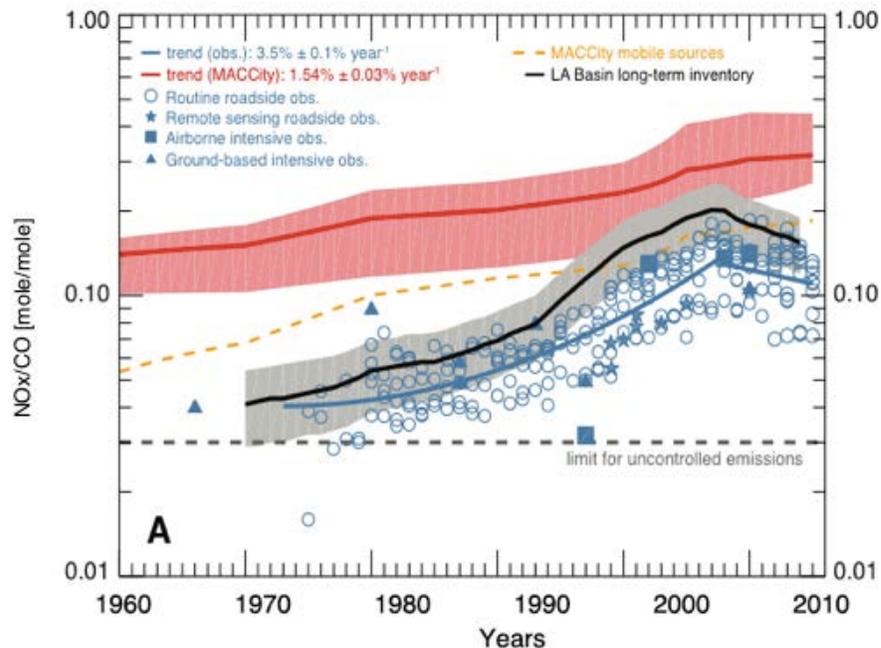

- Wildfire and agricultural burning smoke impact air quality across the North American continent and beyond
- HRRR-SMOKE is a GSL product with an inert tracer to predict smoke impacts and a widely used tool now in the operational stage
- NOAA Rapid Refresh Chemistry (RAP-Chem) updates wildland fire inventories to aid in prediction of surface pollutants such as CO

CSL research to operations transitions data from large scale FireLab and FIREX-AQ campaigns to operational forecast models

Global Emissions

Anthropogenic / Urban

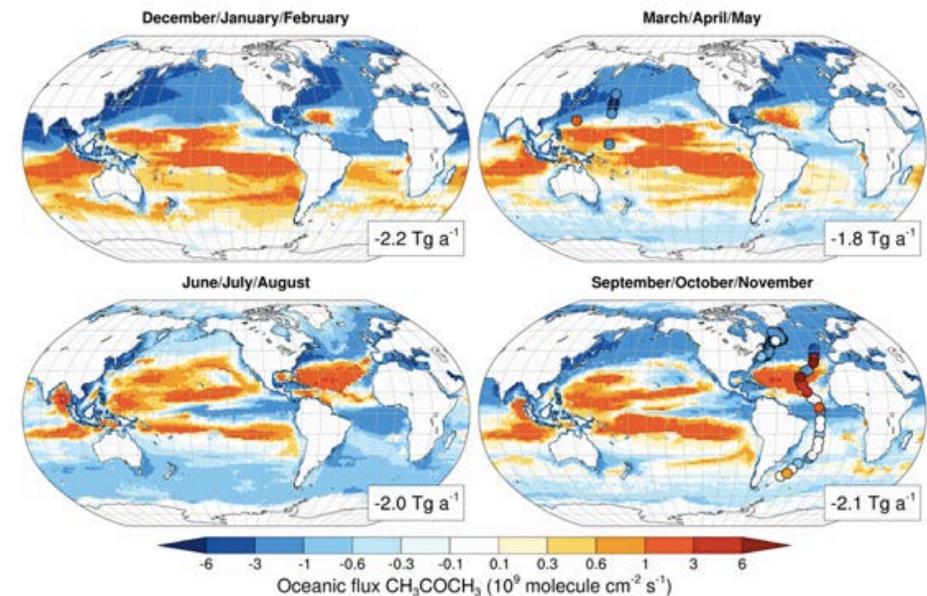

Hassler GRL 2016: Inventory comparisons to long term trends of NO_x/CO in monitoring and field intensive data

Fuel based (grey) superior to conventional (red) inventory

Biogenic / Remote Atmosphere

Wang JGR 2020: Validation of modeled ocean flux of acetone at global scale against ATom observations

Bi-directional ocean flux for remote atmosphere HO_x source

Range of Scales

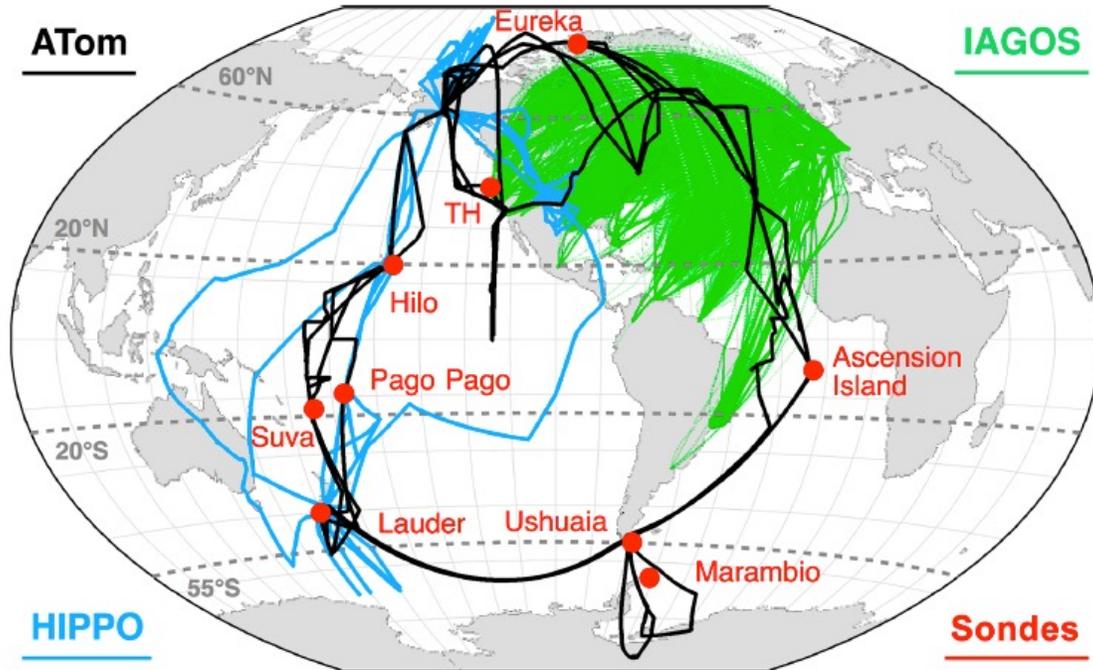

CSL model – observation comparisons constrain emissions across a range of sources and scales

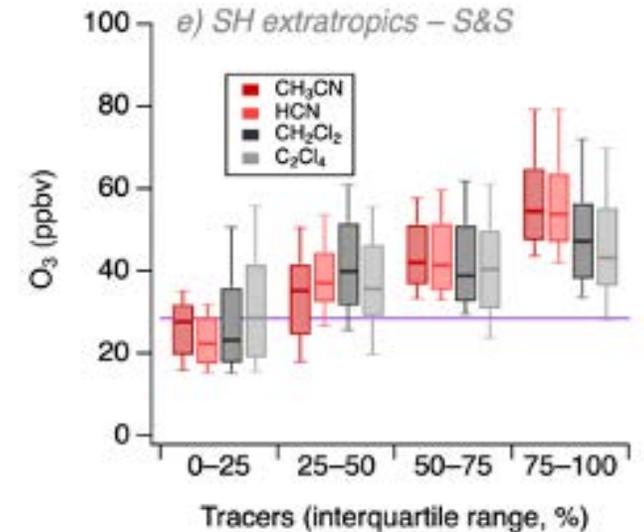

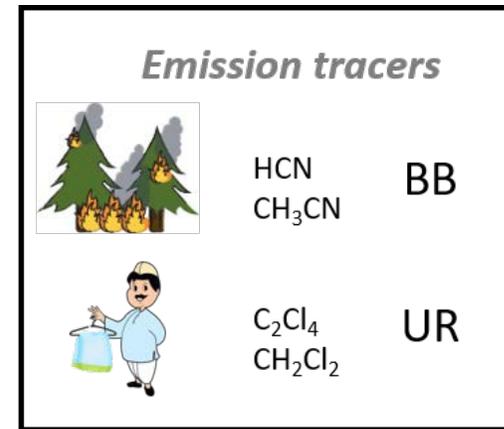

Atmospheric Composition

StoryMap 1.3.3

Ozone in the remote troposphere

Bourgeois 2021 (In prep)

Bourgeois ACP 2020: Extensive data set for remote tropospheric O₃ based on CSL (ATom) & collaborator measurements

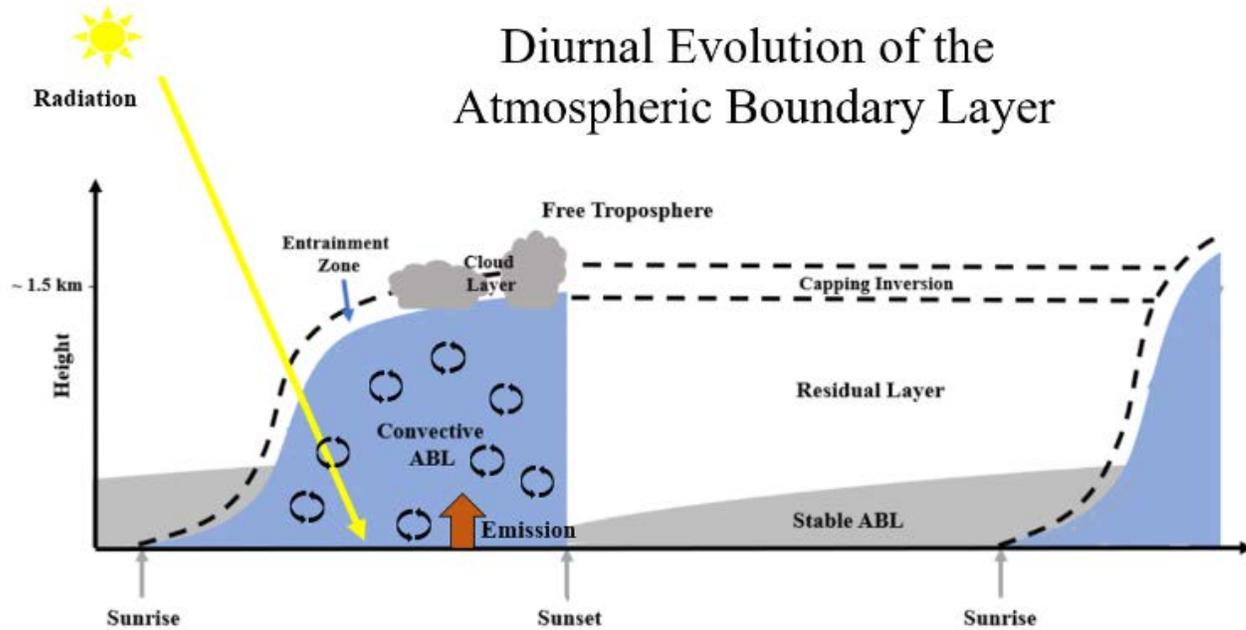

- Tracer relationships for urban (UR) and biomass burning (BB) contributions to remote O₃
- Influence of BB pervasive on remote tropospheric O₃ and larger than models

CSL drives new understanding of global O₃ distribution and sources

Atmospheric Dynamics

StoryMap 1.3.4

Diurnal Evolution of the Atmospheric Boundary Layer

Accurate mixing & transport are required to understand emissions and chemistry of trace gases and aerosols

Deep CSL expertise in remote sensing instruments and interpretation for air quality research

Doppler LIDAR: Mobile

Ground based

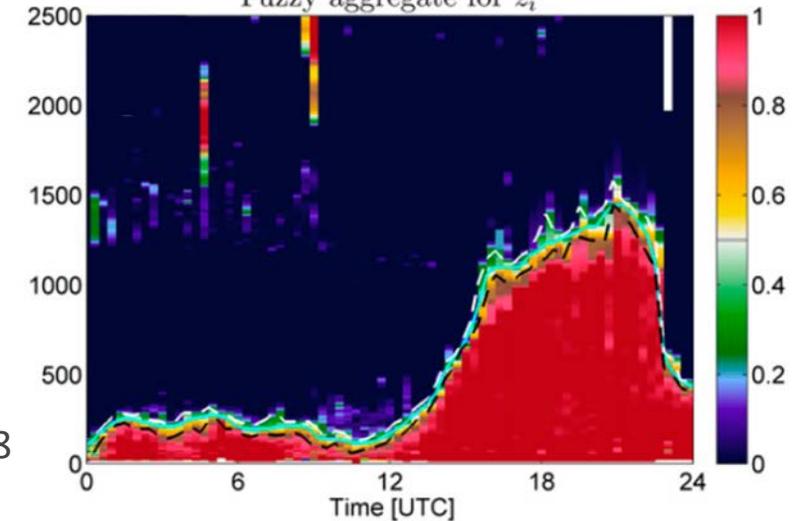

Aircraft

LIDAR data + Fuzzy Logic for boundary layer height evolution

Bonin JTECH 2018

Data from INFLUX campaign
Fuzzy aggregate for z_i

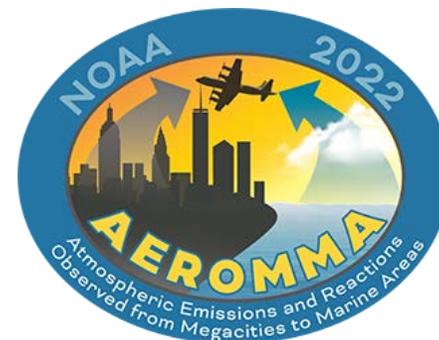

CSL is a global leader in technology & research in boundary layer dynamics

CSL Air Quality Research – The Future

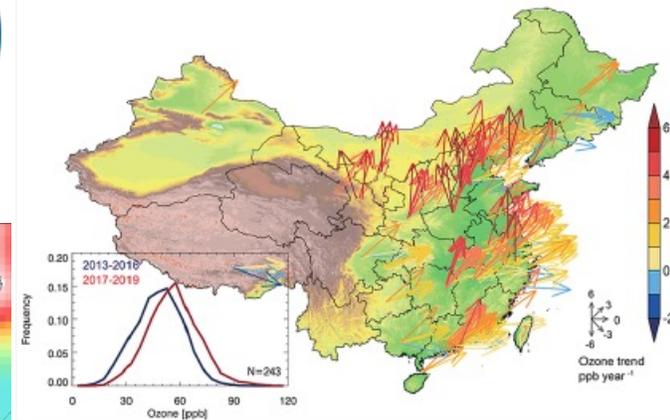

Air Quality and its Impacts in a World of Shifting Emissions

2022: AEROMMA / CUPiDS (Atmospheric Emissions and Reactivity from Megacities to Marine Areas / Coastal Urban Plume Dynamics Study)

2024: AQUARIUS (Air Quality Research in the Western U.S.)

Decreasing U.S. emissions, but AQ trends vary globally

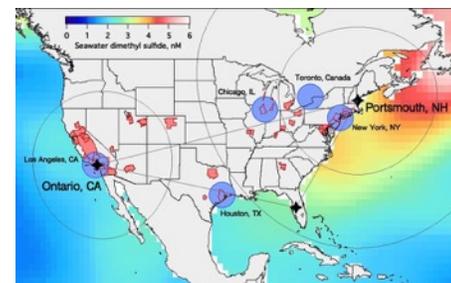

Advanced Observations and Modeling

Geostationary satellite era

Near term: TEMPO, GEMS, SENTINEL

Longer term: NOAA Geo-XO constellation

Lu ES&T Lett 20

Integrated Approaches and Skill Sets

Diverse workforce

National and international partnerships
